## Contents

From the $33^{\text {rd }}$ IChO Secretariat ..... iv
Preface ..... V
Draft Syllabus for the International Chemistry Olympiad ..... vii-xvi
Theoretical Problems ..... 1-36
Problem 1 WaterProblem 2Problem 3Problem 4Problem 5Problem 6Problem 7Problem 8Problem 9Problem 10Problem 11Problem 12Problem 13Problem 14Problem 15van der Waals gases
Rates and reaction mechanisms
Enzyme catalysis
Schrödinger equation
Atomic and molecular orbitals
Fission
Radioactive decay
Redox reactions
Solubility of sparingly soluble salts
Spectrophotometry
Reactions in buffer medium
Identification of an inorganic compound
Ionic and metallic structures
Compounds of nitrogen
Structure elucidation with stereochemistry
Organic spectroscopy and structure determination
Polymer synthesis
Organic synthesis involving regioselection
Carbon acids
Amino acids and enzymes
Coenzyme chemistry
Protein folding
Protein sequencing
Practical Problems37-48
Safety Regulations
Problem 25 Determination of aspirin in the given sampleProblem 26Synthesis of 1-phenyl-azo-2-naphthol $\mathrm{C}_{16} \mathrm{H}_{12} \mathrm{ON}_{2}$Problem 27
Estimation of calcium in a sample solution
Problem 28 Estimation of methyl ketone by back titration
Problem 29
Estimation of phenol in the given sample
Problem 30 Determination of amount of Fe (III) present in the given sample
Worked Solutions to Problems49-111

## SYLLABUS OF THE INTERNATIONAL CHEMISTRY OLYMPIAD

Level 1: These topics are included in the overwhelming majority of secondary school chemistry programs and need not be mentioned in the preparatory problems

Level 3: These topics are not included in the majority of secondary school programs and can only be used in the competition if examples are given in the preparatory problems

## 1 INORGANIC CHEMISTRY

### 1.1 Electronic configuration of atoms and ions

1.1.1 main groups

1
1.1.2 transition metals 2
1.1.3 lanthanide and actinide metals

3
1.1.4 Pauli exclusion principle 1
1.1.5 Hund's rule

1

### 1.2 Trends in the periodic table (main groups)

1.2.1 electronegativity
1.2.2 electron affinity
1.2.3 first ionisation energy 2
1.2.4 atomic size 1
1.2.5 ionic size 2
1.2.6 highest oxidation number 1

### 1.3 Trends in physical properties (main groups)

1.3.1 melting point
1.3.2 boiling point 1
1.3.3 metal character 1
1.3.4 magnetic properties 2
1.3.5 thermal properties
1.3.6 law of Dulong and Petit 1
1.3.7 electrical conductivity

### 1.4 Structures

1.4.1 simple molecular structures 2
1.4.2 simple molecular structures with central atom exceeding octet rule
1.4.3 ionic crystal structures 3
1.4.4 metal structures 3
1.4.5 stereochemistry 3
1.5 Nomenclature
1.5.1 oxidation number 1
1.5.2 main group compounds 1
1.5.3 transition metal compounds 1
1.5.4 simple metal complexes 2
1.5.5 multicenter metal complexes 3
1.6 Chemical calculations
1.6.1 balancing equations 1
1.6.2 stoichiometric calculations 1
1.6.3 mass and volume relations 1
1.6.4 empirical formula 1
1.6.5 Avogadro's number 1
1.6.6 concentration calculations 1

### 1.7 Isotopes

1.7.1 counting of nucleons 1
1.7.2 radioactive decay 1
1.7.3 nuclear reactions (alpha, beta, gamma, neutrino)

### 1.8 Natural cycles

1.8.1 nitrogen
1.8.2 oxygen
1.8.3 carbon

## 1.9 s-Block

### 1.9.1 Products of reactions of group I and II metals

1.9.1.1 with water, basicity of the
products
1.9.1.2 with halogens
1.9.1.3 with oxygen
1.9.2 heavier s-block elements are more reactive
1.9.3 lithium combines with $\mathrm{H}_{2}$ and $\mathrm{N}_{2}$ forming LiH and $\mathrm{Li}_{3} \mathrm{~N}$

### 1.10 p-Block

1.10.1 stoichiometry of simplest
non-metal hydrides
1.10.2 properties of metal hydrides 3
1.10.3 acid-base properties of $\mathrm{CH}_{4}, \mathrm{NH}_{3}$, $\mathrm{H}_{2} \mathrm{O}, \mathrm{H}_{2} \mathrm{~S}$, and hydrogen halides HX
1.10.4 NO reacts with $\mathrm{O}_{2}$ to form $\mathrm{NO}_{2} \quad 1$
1.10.5 equilibrium between $\mathrm{NO}_{2}$ and $\mathrm{N}_{2} \mathrm{O}_{4}$
1.10.6 products of reaction of $\mathrm{NO}_{2}$ with

water
1.10.7 $\mathrm{HNO}_{2}$ and its salts are reductants
1.10.8 $\mathrm{HNO}_{3}$ and its salts are oxidants ..... 1
1.10.9 $\mathrm{N}_{2} \mathrm{H}_{4}$ is a liquid and reductant ..... 3
1.10.10 there exist acids like $\mathrm{H}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}$,
$\mathrm{HN}_{3}$ ..... 3

1.10.11 reactions of $\mathrm{HNO}_{3}$ with different
metals and reductants
1.10.12 reaction of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ with iodine 2
1.10.13 other thioacids, polyacids, peroxoacids
1.10.14 B(III), Al(III), Si(IV), P(V), $\mathrm{S}(\mathrm{IV}), \mathrm{S}(\mathrm{VI}), \mathrm{O}(-\mathrm{II}), \mathrm{F}(-\mathrm{I}), \mathrm{Cl}(-\mathrm{I})$, $\mathrm{Cl}(\mathrm{I}), \mathrm{Cl}(\mathrm{III}), \mathrm{Cl}(\mathrm{V}), \mathrm{Cl}(\mathrm{VII})$ are normal oxidation states of 2nd and 3rd row elements in compounds with halogens and in oxoanions
1.10.15 compounds of non-metals with other oxidation states
1.10.16 the preferred oxidation states are $\mathrm{Sn}(\mathrm{II}), \mathrm{Pb}(\mathrm{II})$ and $\mathrm{Bi}(\mathrm{III})$ ..... 2
oxides with water and stoichiometry of resulting acids1
1.10.18 reactions of halogens with water
1.10.19 reactivity and oxidising power of halogens decrease from $\mathrm{F}_{2}$ to $\mathrm{I}_{2}$ 1
1.10.20 differences of chemistry betweenrow 4 and row 3 elements3

### 1.11 d-Block

1.11.1 common oxidation states of the common d-block metals are $\mathrm{Cr}(\mathrm{III})$, $\mathrm{Cr}(\mathrm{VI}), \mathrm{Mn}(\mathrm{II}), \mathrm{Mn}(\mathrm{IV}), \mathrm{Mn}(\mathrm{VII})$, $\mathrm{Fe}(\mathrm{II}), \mathrm{Fe}(\mathrm{III}), \mathrm{Co}(\mathrm{II}), \mathrm{Ni}(\mathrm{II}), \mathrm{Cu}(\mathrm{I})$, $\mathrm{Cu}(\mathrm{II}), \mathrm{Ag}(\mathrm{I}), \mathrm{Zn}(\mathrm{II}), \mathrm{Hg}(\mathrm{I})$, and $\mathrm{Hg}(\mathrm{II})$ 1
1.11.2 colours of the listed common ions in aqueous solutions
1.11.3 other oxidation states and chemistry of other d-block elements3
1.11.4 $\mathrm{Cr}, \mathrm{Mn}$, $\mathrm{Fe}, \mathrm{Co}, \mathrm{Ni}, \mathrm{Zn}$ dissolve in dilute $\mathrm{HCl} ; \mathrm{Cu}, \mathrm{Ag}, \mathrm{Hg}$ do not dissolve
1.11.5 products of dissolution are ( $2+$ ) cations

2
1.11.6 passivaion of $\mathrm{Cr}, \mathrm{Fe}$ (and also Al) 2
I.11.7 $\mathrm{Cr}(\mathrm{OH})_{3}$ and $\mathrm{Zn}(\mathrm{OH})_{2}$ are amphoteric, other common hydroxides are not 1
1.11.8 $\mathrm{MnO}_{4}^{-}, \mathrm{CrO}_{4}^{2-}, \mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ are strong oxidants
1.11.9 products of reduction of $\mathrm{MnO}_{4}$ depending on pH2

1.11.10 polyanions other than $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$ ..... 3

### 1.12 Other inorganic problems

1.12.1 industrial production of $\mathrm{H}_{2} \mathrm{SO}_{4}$, $\mathrm{NH}_{3}, \mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{Na}, \mathrm{Cl}_{2}, \mathrm{NaOH}$, 1
1.12.2 chemistry of lanthanides and actinides
1.12.3 chemistry of noble gases 3

## 2. PHYSICAL CHEMISTRY

### 2.1 Chemical equilibria

2.1.1 dynamical model of chemical
equilibrium
2.1.2 chemical equilibria expressed in terms of relative concentrations 1
2.1.3 chemical equilibria expressed in terms of partial pressures 2
2.1.4 the relationship between equilibrium constants for ideal gases expressed in different ways (concentration,

Mumbai, India, July 2001
pressure, mole fraction)
2.1.5 relation of equilibrium constant and standard Gibbs energy

### 2.2 Ionic equilibria

2.2.1 Arrhenius theory of acids and bases ..... 1
2.2.2 Broensted-Lowry theory, conjugated acids and bases ..... 1
2.2.3 definition of pH ..... 1
2.2.4 ionic product of water ..... 1
2.2.5 relation between $K_{a}$ and $K_{b}$ for conjugated acids and bases ..... 1
2.2.6 hydrolysis of salts ..... 1
2.2.7 solubility product - definition ..... 1
2.2.8 calculation of solubility (in water) from solubility product ..... 1
2.2.9 calculation of pH for weak acid from $\mathrm{K}_{\mathrm{a}}$ ..... 1
2.2.10 calculation of pH for $10^{-7} \mathrm{~mol} \mathrm{dm}^{-3}$ HCl solution2
2.2.11 calculation of pH for multiprotic acids ..... 2
2.2.12 calculation of pH for weak acid mixtures3
2.2.13definition of activity coefficient ..... 2
2.2.14 definition of ionic strength ..... 3
2.2.15 Debye-Hückel formula ..... 3
2.3 Electrode equilibria
2.3.1 electromotive force (definition) ..... 1
2.3.2 first kind electrodes ..... 1
2.3.3 standard electrode potential ..... 1
2.3.4 Nernst equation ..... 2
2.3.5 second kind electrodes ..... 2
2.3.6 relation between $\Delta \mathrm{G}$ and electromotive force3
2.4 Kinetics of homogeneous reactions
2.4.1 factors influencing reaction rate ..... 1
2.4.2 rate equation ..... 1
2.4.3 rate constant ..... 1
2.4.4 order of reactions ..... 2
2.4.5 1st order reactions: time dependence of concentration ..... 2
2.4.6 1st order reactions: half-life ..... 2
2.4.7 1st order reactions: relation between half-life and rate constant ..... 2
2.4.8 rate-determining step ..... 2
2.4.9 molecularity2
2.4.10 Arrhenius equation, activation energy (definition) ..... 2
2.4.11 calculation of rate constant for 1st order reaction ..... 2
2.4.12 calculation of rate constant for second, third order reaction ..... 3
2.4.13 calculation of activation energy from experimental data ..... 3
2.4.14 basic concepts of collision theory ..... 3
2.4.15 basic concepts of transition state theory ..... 3
2.4.16 opposing, parallel and consecutive reactions ..... 3
2.5 - Thermodynamics (First law)
2.5.1 system and its surroundings ..... 2
2.5.2 energy, heat and work ..... 2
2.5.3 relation between enthalpy and energy ..... 2
2.5.4 heat capacity - definition ..... 2
2.5.5 difference between $\mathrm{C}_{\mathrm{p}}$ and $\mathrm{C}_{\mathrm{v}}$ (ideal gas only) ..... 2
2.5.6 Hess law ..... 2
2.5.7 Born-Haber cycle for ionic compounds ..... 3
2.5.8 lattice energies - approximate calculations (e.g. Kapustinski equation) ..... 3
2.5.9 use of standard formation enthalpies ..... 2
2.5.10 heats of solution and solvation ..... 2
2.5.11 bond energies - definition and uses 2
2.6 Thermodynamics (Second law)
2.6.1 entropy, definition ( $q / T$ ) ..... 2
2.6.2 entropy and disorder ..... 2
2.6.3 relation $\mathrm{S}=\mathrm{k} \ln \mathrm{W}$ ..... 3
2.6.4 relation $\Delta \mathrm{G}=\Delta \mathrm{H}-\mathrm{T} \Delta \mathrm{S}$ ..... 2
2.6.5 $\Delta \mathrm{G}$ and directionality of changes ..... 2
2.7 Phase systems
2.7.1 ideal gas law ..... 1
2.7.2 van der Waals gas law ..... 3
2.7.3 definition of partial pressure ..... 1
2.7.4 temperature dependence of the vapour pressure of liquid ..... 2
2.7.5 Clausius-Clapeyron equation ..... 3
2.7.5 reading phase diagrams: triple point ..... 3
2.7.6 phase diagrams: critical temperature ..... 3
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
2.7.8 liquid-vapour system (diagram) ..... 3
2.7.9 liquid-vapour: ideal and non-ideal systems
2.7.10 liquid-vapour: use in fractional
2.7.11 Henry's law3
distillation3
2.7.12 Raoult's law2
2.7.13 deviations from Raoult's law1
2.7.14 boiling point elevation law ..... 23 3.5.6 nomenclature of heterocycles
2.7.15 freezing point depression, determination of molar mass2
2.7.16 osmotic pressure ..... 2
2.7.17 partition coefficient ..... 3
2.7.18 solvent extraction ..... 3
2.7.19 basic principles of chromatography2
3. ORGANIC CHEMISTRY
3.1 Alkanes
3.1.1 isomers of butane ..... 1
3.1.2 naming (IUPAC) ..... 1
3.1.3 trends in physical properties1
3.1.4 substitution (e.g. with $\mathrm{Cl}_{2}$ )3.1.4.1 products
3.1.4.2 free radicals
3.1.4.3 initiation/termination of the chain reaction12
2 3.6.7 Wurtz $(\mathrm{RX}+\mathrm{Na})$ reaction ..... 3
3.6.8 halogen derivatives and pollution ..... 32
3.2 Cycloalkanes
3.2.1 names ..... 1
3.2.2 strain in small rings ..... 2
3.2.3 chair/boat conformation
3.3 Alkenes2
3.3.1 planarity ..... 1
3.3.2 $\mathrm{E} / \mathrm{Z}$ (cis-trans) isomerism ..... 1
3.3.3 Addition of $\mathrm{Br}_{2}$ and HBr
1
3.3.3.1 products
3.3.3.2 Markovnikoff's rule ..... 2
3.3.3.3 carbonium ions in addition reaction ..... 3
3.3.3.4 relative stability of carbonium ions 3
3.3.3.5 1,4-addition to alkadiene ..... 3
3.4 Alkynes
3.4.1 linear geometry ..... 1
3.4.2 acidity ..... 2
3.4.3 differences in chemical properties between alkenes and alkynes33
3.7 Alcohols and phenols
3.7.1 hydrogen bonding - alcohols vs ethers ..... 1
3.7.2 acidity of alcohols vs phenols ..... 2
3.7.3 dehydration to alkenes ..... 1
3.7.4 dehydration to ethers ..... 2
3.7.5 esters with inorganic acids ..... 2
3.7.6 iodoform reaction ..... 2
3.7.7 reactions of primary/secondary/ tertiary: Lucas reagent ..... 2
3.7.8 formula of glycerin ..... 1
3.8 Carbonyl compounds
3.8.1 nomenclature ..... 1
3.8.2 keto/enol tautomerism ..... 2
3.8.3 Preparation of carbonyl compounds
3.8.3.1 oxidation of alcohols ..... 1
3.8.3.2 from carbon monoxide ..... 3
3.8.4 Reaction of carbonyl compounds
3.8.4.1 oxidation of aldehydes ..... 1
3.8.4.2 reduction with Zn metal ..... 2
3.8.4.3 addition of HCN ..... 2
3.8.4.4 addition of $\mathrm{NaHSO}_{3}$ ..... 2
3.8.4.5 addition of $\mathrm{NH}_{2} \mathrm{OH}$
3.8.4.6 aldol condensation
3.8.4.7 preparation of acetates
3.8.4.8 Cannizzaro ( $\mathrm{PhCH}_{2} \mathrm{OH}$ disproportionation)
3.8.4.9 Grignard reaction
3.8.4.10 Fehling ( $\mathrm{Cu}_{2} \mathrm{O}$ ) and Tollens (Ag mirror)

### 3.10 Carboxylic acids

3.10.1 inductive effect and strength 2
3.10.2 equivalence of oxygen atoms in anions

### 3.10.3 Preparation and reactions of carboxylic acids

3.10.3.1 preparation from esters
3.10.3.2 preparation from nitriles
3.10.3.3 products of reaction with alcohols (esters)
3.10.3.4 mechanism of esterification

2
$\begin{array}{ll}\text { 3.10.3.5 } & \text { isotopes in mechanism } \\ \text { elucidation }\end{array}$
3.10.3.6 nomenclature of acid halides
3.10.3.7 preparation of acid chlorides
3.10.3.8 preparation of amides from acid chlorides
3.10.3.9 preparation of nitriles from acid chlorides
3.10.3.10 properties and preparation of anhydrides 2

1

3
2
2
3.10.3.11 oxalic acid name and formula 1
3.10.3.12 multifunctional acids (e.g. hydroxyacids, ketoacids) 2
3.10.3.13 polycarboxylic acids 2
3.10.3.14 optical activity (e.g. lactic acid 2
3.10.3.15 R/S nomenclature
3.10.3.16 plant and animal fats, differences

### 3.11 Nitrogen compounds

3.11.1 basicity of amines
3.11.2 comparing aliphatic vs aromatic 2
3.11.3 names: primary, secondary, tertiary, quaternary amines

2
3.11.4 identificationof primary/sec./tert./ 3
3.11.5 Preparation of amines
3.11.5.1 from halogen compounds
3.11.5.2 from nitro compounds (e.g. $\mathrm{PhNH}_{2}$ from $\mathrm{PhNO}_{2}$ )
3.11.5.3 from amides (Hoffmann)

2 3.11.6 mechanism of Hoffmann rearrangement in acidic/basic medium
3.11.7 basicity amines vs amides 2
3.11.7 diazotation products of aliphatic amines3

3.11.9 diazotation products of
aromatic amines ..... 3
3.11.10 dyes:colour vs structure (chromophore groups) ..... 3
3.11.11 nitrocompounds: aci/nitro tautomerism ..... 3
3.11.12 Beckmann(oxime-amide) rearrangements ..... 3

### 3.12 Some large molecules

3.12.1 hydrophilic/hydrophobic groups 2
3.12.2 micelle structure ..... 3
3.12.3 preparation of soaps ..... 1
products of polymerization of:3.12.4 styrene2
3.12 .5 ethene ..... 1
3.12.6 polyamides ..... 3
3.12.7 phenol + aldehydes ..... 3
3.12 .8 polyuretanes ..... 3
3.12.9 polymers cross linking ..... 3
3.12.10 chain mechanism of polymer formation ..... 2
3.12.11 rubber composition ..... 3
4. BIOCHEMISTRY
4.1 Amino acids and peptides
4.1.1 ionic structure of aminoacids ..... 1
4.1.2 isoelectric point ..... 2
4.1.3 20 aminoacids (classification in groups) ..... 2
4.1.4 20 aminoacids (names and structures) ..... 3
4.1.5 ninhydrin reaction (including equation) ..... 3
4.1.6 separation by chromatography ..... 3
4.1.7 separation by electrophoresis ..... 3
4.1.8 peptide linkage ..... 1
4.2 Proteins
4.2.1 primary structure of proteins ..... 1
4.2.2 -S-S- bridges ..... 3
4.2.3 sequence analysis ..... 3
4.2.4 secondary structures ..... 3
4.2.5 details of alpha-helix structure ..... 3
4.2.6 tertiary structure ..... 3
4.2.7 denaturation reaction by changeof pH , temperature, metals,ethanol2
4.2.8 quaternary structure ..... 3
4.2.9 separation of proteins (molecule size and solubility) ..... 3
4.2.10 metabolism of proteins (general) ..... 3
4.2.11 proteolysis ..... 3
4.2.12 transamination ..... 3
4.2.13 four pathways of catabolism of amino acids ..... 3
4.2.14 decarboxylation of amino acids ..... 3
4.2.15 urea cycle (only results) ..... 3
4.3 Fatty acids and fats
4.3.1 IUPAC names from $\mathrm{C}_{4}$ to $\mathrm{C}_{18}$ ..... 2
4.3.2 trivial names of most important (ca. 5) fatty acids ..... 2
4.3.3 general metabolism of fats ..... 2
4.3.4 beta-oxidation of fatty acids (formulas and ATP balance) ..... 3
4.3.5 fatty acids and fats anabolism ..... 3
4.3.6 phosphoglycerides ..... 3
4.3.7 membranes ..... 3
4.3.8 active transport ..... 3
4.4 Enzymes
4.4.1 general properties, active centres 2
4.4.2 nomenclature, kinetics, coenzymes, function of ATP, etc. ..... 3
4.5 Saccharides
glucose and fructose:
4.5.1 - chain formulas ..... 2
4.5.2 - Fischer projections ..... 2
4.5.3 - Haworth formulas ..... 3
4.5.4 osazones ..... 3
4.5.5 maltose as reducing sugar ..... 2
4.5.6 difference between starch and cellulose2
4.5.7 difference between alpha- and beta-D glucose2
4.5.8 metabolism from starch to acetyl -CoA3
4.5.9 pathway to lactic acid or to ethanol; catabolism of glucose ..... 3
4.5.10 ATP balance for the above pathways ..... 3
4.5.11 photosynthesis (products only) ..... 2
4.5.12 light and dark reaction ..... 3
4.5.13 detailed Calvin cycle ..... 3
4.6 Krebs cycle and respiration chain
4.6.1 formation of $\mathrm{CO}_{2}$ in the cycle (no details) ..... 3
4.6.2 intermediate compounds in the cycle ..... 3
4.6.3 formation of water and ATP (no details) ..... 3
4.6.4 FMN and cytochromes ..... 3
4.6.5 calculation of ATP amount for 1 mole of glucose ..... 3
4.7 Nucleic acids and protein synthesis
4.7.1 pyrimidine, purine ..... 2
4.7.2 nucleosides and nucleotides ..... 3
4.7.3 formulas of all pyrimidine and purine bases ..... 3
4.7.4 difference between ribose and 2-deoxyribose ..... 3
4.7.5 base combination CG and AT ..... 3
4.7.6 base combination CG and AT - (hydrogen bonding structure) 3
4.7.7 difference between DNA and RNA 3
4.7.8 difference between mRNA andtRNA3
4.7.9 hydrolysis of nucleic acids ..... 3
4.7.9 semiconservative replication of DNA ..... 3
4.7.11 DNA-ligase ..... 3
4.7.12 RNA synthesis (transcription) without details ..... 3
4.7.13 reverse transcriptase ..... 3
4.7.14 use of genetic code ..... 3
4.7.15 start and stop codons ..... 3
4.7.16 translation steps ..... 3
4.8 Other biochemical problems
4.8.1 hormones, regulation ..... 3
4.8.2 hormones, feedback ..... 3
4.8.3 insulin, glucagon, adrenaline ..... 3
4.8.4 mineral metabolism (no details) ..... 3
4.8.5 ions in blood ..... 3
4.8.6 buffers in blood ..... 3
4.8.7 haemoglobin; function and skeleton 34.8.8 haemoglobin; diagram of oxygenabsorption3
4.8.9 steps in clotting the blood ..... 3
4.8.10 antigens and antibodies ..... 3
4.8.11 blood groups ..... 3
4.8.12 acetyl choline, structure and functions ..... 3

## OTHER PROBLEMS

## 5. Analytical chemistry

5.1 choice of indicators for acidimetry 1
5.2 titration curve; pH (strong and weak
5.3 EMF (redox titration)
$\begin{array}{ll}5.4 & \text { calculation of } \mathrm{pH} \text { of simple } \\ \text { buffer solution }\end{array}$ 2
5.5 identification of $\mathrm{Ag}^{+}, \mathrm{Ba}^{2+}, \mathrm{Cl}^{2}, \mathrm{SO}_{4}{ }^{2-}-1$
5.6 identification of $\mathrm{Al}^{3+}, \mathrm{NO}_{2}^{-}, \mathrm{NO}_{3}^{-}, \mathrm{Bi}^{3+2}$
5.7 identification of $\mathrm{VO}_{3}^{-}, \mathrm{ClO}_{3}^{-}, \mathrm{Ti}^{4+} \quad 3$
5.8 use of flame tests for identification of K, Ca a Sr
5.9 Beer-Lambert law 2

## 6. Complexes

6.1 writing down complexation reactions1
6.2 definition of coordination number 1
6.3 prediction of coordination number of complex ions and molecules 3
$6.4 \begin{aligned} & \text { complex formation constants } \\ & \text { (definition) }\end{aligned}$
$6.5 \quad E_{g}$ and $T_{2 g}$ terms: high and low spin octahedral complexes 3
6.6 calculation of solubility of AgCl in $\mathrm{NH}_{3}$ (from $\mathrm{K}_{\mathrm{s}}$ and constants $\beta$ ) 3
6.7 cis and trans forms 3

## 7. Theoretical chemistry

7.1 energy levels of hydrogen atom
(formula)

constant from X-ray data

### 8.6 Polarimetry

8.6.1 calculation of specific rotation angle3

## Syllabus for the Experimental Part of the IChO Competition

#### Abstract

Level 1 is assigned to the basic experimental activities which are supposed to be mastered by competitors very well. Level 2 is assigned to the activities which are parts of school experimental exercises in developed countries and the authors of IChO tasks may incorporate them into the tasks without being bounded to mention it in advance. Level 3 is assigned to such activities which are not in the chemistry syllabus in the majority of participating countries and the authors are obliged to mention them in the set of preparatory tasks.

## 1. Synthesis of inorganic and organic compounds

1.1 heating with burners and hotplates 1
1.2 heating of liquids

1
1.3 handling the work with inflammable
substances and materials1
1.4 measuring of masses (analytical balance) ..... 1
1.5 measuring of volumes of liquids (measuring cylinder, pipette, burette) 1
1.6 preparation of solutionsfrom a solid compound and solvent 1
1.7 mixing and dilution of solutions ..... 1
1.8 mixing and stirring of liquids ..... 1
1.9 using mixer and magnetic stirrer ..... 2
1.10 using a dropping funnel ..... 1

## Values of Some Fundamental Constants

| Avogadro number | $\mathrm{N}_{\mathrm{A}}=6.022 \times 10^{23} \mathrm{~mol}^{-1}$ |
| :--- | :--- |
| Faraday constant | $\mathrm{F}=96485 \mathrm{C} \mathrm{mol}^{-1}$ |
| Gas constant | $\mathrm{R}=8.314 \mathrm{J}. \mathrm{~K}^{-1} \cdot \mathrm{~mol}^{-1}$ |
| Planck's constant | $\mathrm{h}=6.626 \times 10^{-34} \mathrm{~J} . \mathrm{s}$ |
| Mass of electron | $\mathrm{m}_{\mathrm{e}}=9.110 \times 10^{-31} \mathrm{~kg}$ |

## Notes:

1. The symbol $[X]$ denotes concentration of $X$. It may carry the unit $\mathrm{mol}_{\mathrm{L}^{-1}}$ or, in some places, may denote concentration relative to the standard concentration of 1 M , in which case it is dimensionless. The particular usage should be obvious from the context. All equilibrium constants are dimensionless.
2. The knowledge of mathematics required for the contest problems of the 33rd IChO will be no more than that indicated by the problems in this collection.

## Theoretical Problems

## Problem 1 Water

Water, the commonest substance around us, is an excellent system to understand many concepts of thermodynamics. It exists in three different phases: solid (ice), liquid and vapour. [At high pressures, different solid phases of ice exist, but we do not consider them here.] The phase diagram for water, which gives the pressure versus temperature curves for its different phases in equilibrium, is shown below:

## A. Phase diagram

a. At what temperature and pressure do all the three phases of water coexist in equilibrium?
b. What is the effect of decrease of pressure on boiling point of water and melting point of ice, as seen from the phase diagram?
c. The liquid-vapour coexistence curve ends at the point $\mathrm{P}_{\mathrm{c}}=223$ bar and $\mathrm{T}_{\mathrm{c}}=$ $374^{\circ} \mathrm{C}$. What is the significance of this point?
d. What is the phase of water at $\mathrm{T}=300 \mathrm{~K}, \mathrm{P}=12.0 \mathrm{bar} ; \mathrm{T}=270 \mathrm{~K}, \mathrm{P}=1.00$ bar?
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
e. Below what value of pressure will ice, when heated isobarically, sublimate to vapour?
f. At a certain temperature and pressure on the liquid-vapour co-existence line, the molar volumes of water in the two phases are

$$
\overline{\mathrm{V}}_{\ell}=3.15 \times 10^{-5} \mathrm{~m}^{3} \quad \overline{\mathrm{~V}}_{\mathrm{v}}=15.8 \times 10^{-5} \mathrm{~m}^{3}
$$

For 1.00 mole of water in a 0.100 litre vessel at this temperature and pressure, determine the volume fractions in liquid and vapour phases.
B. Clausius - Clapeyron equation
a. Explain your answer to part A. b above on the basis of the Clapeyron equation.
b. Autoclaves used for medical sterilisation need to have a temperature of $120^{\circ} \mathrm{C}$ of boiling water to kill most bacteria. Estimate the pressure required for the purpose. The molar enthalpy change of vaporisation of water is $40.66 \mathrm{~kJ} \mathrm{~mol}^{-1}$ at the normal boiling point. Indicate the assumptions made in your estimate.
c. The molar enthalpy change of fusion at normal freezing point (273.15 K) is $6008 \mathrm{~J} \mathrm{~mol}^{-1}$. Estimate the pressure at which water and ice are in equilibrium at $-0.200{ }^{\circ}$. Density of ice $=917 \mathrm{~kg} \mathrm{~m}^{-3}$ and density of water $=1000 \mathrm{~kg} \mathrm{~m}^{-3}$. Indicate the assumptions made in your estimate.
C. Irreversible condensation
a. Consider 28.5 g of supercooled (liquid) water at $-12.0^{\circ} \mathrm{C}$ and 1.00 bar. Does this state lie on the P - T plane of the phase diagram?
b. This metastable state suddenly freezes to ice at the same temperature and pressure. Treat the metastable state as an equilibrium state and calculate the heat released in the process. Molar heat capacities, assumed constant, are :

$$
\begin{aligned}
& \overline{\mathrm{C}}_{\text {p(ice) }}=76.1 \mathrm{JK}^{-1} \mathrm{~mol}^{-1} \\
& \overline{\mathrm{C}}_{\text {P(iquid water) }}=37.15 \mathrm{JK}^{-1} \mathrm{~mol}^{-1} \\
& \Delta \overline{\mathrm{H}}_{\text {(usion) }}=-333.5 \mathrm{Jg}^{-1}
\end{aligned}
$$

c. Determine the total entropy change of the universe in the process and assure yourself that the answer is consistent with the Second Law of Thermodynamics. Take the surroundings to be at $-12.0^{\circ} \mathrm{C}$.

## Problem 2 van der Waals gases

The ideal gas equation PV = nRT implies that the compressibility factor
$Z=\frac{P V}{n R T}=1$
However, the compressibility factor is known to deviate from 1 for real gases. In order to account for the behavior of real gases, van der Waals proposed the following equation of state :
$\left(P+\frac{n^{2} a}{V^{2}}\right)(V-n b)=n R T$
where $a$ and $b$ are constants, characteristic of the gas. The constant $a$ is a measure of the intermolecular force and $b$ that of the size of the molecules.
a. Show on the basis of van der Waals equation that
i. at sufficiently high temperatures, $Z$ is greater than unity for all pressures. At high temperatures and low pressures, $Z$ approaches the value for an ideal gas.
ii. at lower temperatures, $Z$ can be less than unity.
iii. for $a=0, Z$ increases linearly with pressure.
b. At a certain temperature, the variation of $Z$ with P for He and $\mathrm{N}_{2}$ is shown schematically in the following figure.

For He, $\quad a=3.46 \times 10^{-2}$ bar L $^{2} \mathrm{~mol}^{-2}$ and $\quad b=2.38 \times 10^{-2} \mathrm{Lmol}^{-1}$
For $\mathrm{N}_{2}, \quad a=1.37$ bar L $^{2} \mathrm{~mol}^{-2} \quad$ and $\quad b=3.87 \times 10^{-2} \mathrm{Lmol}^{-1}$

Identify the graph corresponding to He and $\mathrm{N}_{2}$.
c. Two P-V isotherms of a van der Waals gas are shown below schematically. Identify the one that corresponds to a temperature lower than the critical temperature $\left(T_{c}\right)$ of the gas.

d. For a given $P$, the three roots of van der Waals equation in $V$ coincide at a certain temperature $T=T_{c}$. Determine $T_{c}$ in terms of $a$ and $b$, and use the result to show that $\mathrm{N}_{2}$ is liquefied more readily than He .
e. Determine the work done by 1 mol of $\mathrm{N}_{2}$ gas when it expands reversibly and isothermally at 300 K from 1.00 L to 10.0 L , treating it as a van der Waals gas.

## Problem 3 Rates and reaction mechanisms

The observed rate law for a chemical reaction can arise from several different mechanisms. For the reaction

$$
\mathrm{H}_{2}+\mathrm{I}_{2} \rightarrow 2 \mathrm{HI}
$$

the observed rate law is
$-\frac{\mathrm{d}\left[\mathrm{H}_{2}\right]}{\mathrm{dt}}=\mathrm{k}\left[\mathrm{H}_{2}\right]\left[\mathrm{I}_{2}\right]$
For a long time it was believed that the above reaction took place as it was written down; that is, it was a bimolecular elementary reaction. It is now considered that several mechanisms compete. Below a certain temperature, two alternative mechanisms have been proposed :
(1) $\mathrm{I}_{2} \rightleftharpoons 2 \mathrm{l} \quad \mathrm{K}$ : equilibrium constant $\mathrm{I}+\mathrm{I}+\mathrm{H}_{2} \xrightarrow{\mathrm{k}_{1}} 2 \mathrm{HI}$
(2) $\mathrm{I}_{2} \rightleftharpoons\left(\mathrm{I}_{2}\right)_{\mathrm{d}} \quad \mathrm{K}^{\prime}$ : equilibrium constant
$\left(\mathrm{I}_{2}\right)_{\mathrm{d}}+\mathrm{H}_{2} \quad \xrightarrow{\mathrm{k}_{1}} 2 \mathrm{HI}$
where $\left(I_{2}\right)_{d}$ represents a dissociative state of $I_{2}$. The first step in each mechanism is fast and the second slow.
a. Show that both mechanisms are consistent with the observed rate law.
b. The values of the rate constant $k$ for the reaction at two different temperatures are given in the table :

| $\mathrm{T}(\mathrm{K})$ | $\mathrm{k}\left(\mathrm{L} \mathrm{mol}^{-1} \mathrm{~s}^{-1}\right)$ |
| :---: | :---: |
| 373.15 | $8.74 \times 10^{-15}$ |
| 473.15 | $9.53 \times 10^{-10}$ |

i. Determine the activation energy $\mathrm{E}_{\mathrm{a}}$.
ii. The bond dissociation energy of $\mathrm{I}_{2}$ is $151 \mathrm{~kJ} \mathrm{~mol}^{-1}$. Justify why the second step in each mechanism is rate determining.
c. The change in internal energy $(\Delta \mathrm{U})$ for the reaction is $-8.2 \mathrm{~kJ} \mathrm{~mol}^{-1}$. Determine the activation energy for the reverse reaction.
d. The activation energy for a reaction can even be negative. An example is the gas phase recombination of iodine atoms in the presence of argon:

$$
I+I+A r \quad \rightarrow \quad I_{2}+A r
$$

$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
whose activation energy is about $-6 \mathrm{~kJ} \mathrm{~mol}^{-1}$.

One of the proposed mechanisms of this reaction is :
$I+A r+A r \rightleftharpoons I A r+A r \quad K^{\prime \prime}:$ equilibrium constant
$\mathrm{IAr}+\mathrm{I} \xrightarrow{\mathrm{k}_{3}} \mathrm{I}_{2}+\mathrm{Ar}$
where IAr is a very loosely bound species.
i. Assume that the second step is rate determining and obtain the rate law for the reaction.
ii. Give a possible explanation of why the activation energy for the iodine recombination is negative.

## Problem 4 Enzyme catalysis

Enzymes play a key role in many chemical reactions in living systems. Some enzyme-catalysed reactions are described in a simple way by the Michaelis-Menten mechanism, as given below.

where $E$ stands for the enzyme, $S$ stands for the substrate on which it acts and $P$, the end product of the reaction. $k_{1}$ and $k_{1}$ are the forward and backward rate constants for the first step and $k_{2}$ the forward rate constant for the second step.

Ignore the backward rate for the second step. Also assume that the enzyme equilibrates with its substrate very quickly.
a. In an experiment, the initial rate (of formation of $P$ ) is determined for different concentrations of the substrate, keeping the total concentration of enzyme fixed at $1.5 \times 10^{-9} \mathrm{M}$. The following graph is obtained.

i. The graph is linear for small [S] and it approaches a constant value for large [S]. Show that these features are consistent with the MichaelisMenten mechanism. (Use steady state approximation for the intermediate step.)
ii. Determine the rate constant $k_{2}$ for the second step.
iii. Predict the initial rate on the basis of the Michaelis-Menten mechanism for the substrate concentration $[\mathrm{S}]=1.0 \times 10^{-4} \mathrm{M}$.
iv. Determine the equilibrium constant for the formation of the enzyme substrate complex ES.
b. The experiment above studied at 285 K is repeated for the same total enzyme concentration at a different temperature ( 310 K ), and a similar graph is obtained, as shown below.

Determine the activation energy for the conversion of $E S$ to $E$ and $P$.
c. One interesting application of the ideas above is the way enzyme catalysed reactions inactivate antibiotics. The antibiotic penicillin is, for example, inactivated by the enzyme penicillinase secreted by certain bacteria. This enzyme has a single active site. Suppose, for simplicity, that the rate constants obtained in a above apply to this reaction. Suppose further that a dose of $3.0 \mu \mathrm{~mol}$ of the antibiotic triggers the release of $2.0 \times 10^{-6} \mu \mathrm{~mol}$ of the enzyme in a 1.00 mL bacterial suspension.
i. Determine the fraction of the enzyme that binds with the substrate (penicillin) in the early stage of the reaction.
ii. Determine the time required to inactivate $50 \%$ of the antibiotic dose.
d. To control the inactivation of penicillin, suppose a substance is introduced which has a similar structure to penicillin and is able to occupy the enzyme site, but is otherwise completely unreactive. This naturally inhibits the enzyme-catalysed reaction. The degree of inhibition $i$ is defined by

$$
i=1-\frac{r}{r_{0}}
$$

where $r$ and $r_{0}$ are the initial rates of reaction with and without the inhibitor respectively.

Consider again the Michaelis-Menten type of mechanism to describe the situation :
$E+S \underset{k_{1}{ }^{\prime}}{\stackrel{k_{1}}{ } E S \text { S } 10}$
$E+1 \xlongequal[k_{3}{ }^{\prime}]{\mathrm{k}_{3}} \mathrm{El}$
$\mathrm{ES} \xrightarrow{\mathrm{k}_{2}} \mathrm{E}+\mathrm{P}$
i. Show that the degree of inhibition decreases with increase in concentration of the substrate (for constant concentration of the inhibitor), and the inhibitor ceases to be effective for large substrate concentrations. (This is known as competitive inhibition.)
ii. For low substrate concentration of penicillin, determine the concentration of the inhibitor that reduces the rate of the inactivation of penicillin by a factor of 4 . The dissociation constant of enzyme-inhibitor complex is given to be $5.0 \times 10^{-5}$.

## Problem 5 Schrödinger equation

The simplest Schrödinger equation, describing a free particle confined to move in a one-dimensional 'rigid box' brings out a most basic fact: quantization arises due to boundary conditions on the wave function.
a. An electron of mass $m$ is confined to move in a line along the $x$-axis from $x=0$ to $x=L$. Between the two ends it experiences no force.
i. Write down the (time-independent) Schrödinger equation for the wave function $\psi$ of an electron.
ii. Which of the following are possible wave functions of an electron in one-dimensional rigid box :
$e^{-k x}$
$\cos \frac{n \pi x}{\mathrm{~L}}$
$\sin k x$
$\sin \frac{n \pi x}{\mathrm{~L}}$
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
where k is any real number and n is a positive integer ?
iii. For the acceptable wave functions of the electron in (ii) above, show that the energies are given by

$$
E_{n}=\frac{h^{2} n^{2}}{8 m L^{2}}
$$

iv. Plot schematically the wave function of the electron in the ground and the first two excited states. What is the number of nodes (in the region between $x=0$ to $L$ ) of the wave function with energy $E_{n}$ ?
v. Normalize the ground state wave function of the electron.
(The integral of the square of the modulus of a normalized wave function over all space is unity.)
b. An interesting example of this one-dimensional model in chemistry is the motion of an electron in a conjugated system of single and double bonds. The molecule 1,3-butadiene has four $\pi$ electrons assumed to move freely in a line consisting of three carbon-carbon bonds, each of approximately the same length $\left(1.4 \times 10^{-10} \mathrm{~m}\right)$, with an additional length of $1.4 \times 10^{-10} \mathrm{~m}$ at each end. Using the aufbau principle, determine a scheme to fill the electrons in the available energy levels. Calculate the lowest excitation energy of the system.
c. 'Boundary conditions' on wave functions result in quantization of not only energy but also other physical quantities, such as angular momentum.

The wave function corresponding to the value $h \lambda / 2 \pi$ for the $z$-component of angular momentum $\left(L_{z}\right)$ is:
$\psi(\phi)=\mathrm{e}^{\mathrm{i} \lambda \phi}$,
where $\phi$ is the (azimuthal) angle in the $x-y$ plane measured relative to the $x$ axis. Use the condition that this function is single valued at every point in space and show that this implies that $\lambda$ is quantized. Give the quantized values of angular momentum projection along the $z$-axis.

## Problem 6 Atomic and molecular orbitals

Orbitals are one-electron wave functions, whether they refer to electronic motion in an atom (atomic orbitals) or in a molecule (molecular orbitals) or a solid. Each orbital corresponds to a certain probability distribution of finding an electron in different regions of space.

## A. Atomic orbitals

a. The 1s orbital of hydrogen atom is given by
$\Psi_{1 \mathrm{~s}}=\mathrm{e}^{-\mathrm{r} / \mathrm{a}_{\circ}}$,
where $a_{0}$ is the Bohr radius $\left(a_{0}=5.3 \times 10^{-11} \mathrm{~m}\right)$ and $r$ is the radial coordinate (distance of a point in space from the centre).
i. Normalize the given wave function.
ii. At what distance from the nucleus is the electron most likely to be found?
b. The wave functions for $2 \mathrm{~s}, 2 \mathrm{p}_{\mathrm{z}}$ and $3 \mathrm{~d}_{\mathrm{z}}{ }^{2}$ states are given below :
$\Psi_{2 s}=\left(2-\frac{r}{a_{o}}\right) e^{-\frac{r}{2 a_{o}}}$
$\Psi_{2 p_{z}}=\left(\frac{r}{a_{o}}\right) \cos \theta e^{-\frac{r}{2 a_{o}}}$
$\Psi_{3 z_{z^{2}}}=\left(\frac{r^{2}}{a_{o}^{2}}\right)\left(3 \cos ^{2} \theta-1\right) e^{-\frac{r}{3 a_{o}}}$
What are the nodal surfaces of these orbitals?
c. It turns out that the solution of Schrödinger equation for a one-electron atom yields exactly the 'good old' formula of Bohr for quantized energies:
$E_{n}=-\frac{(13.6 \mathrm{eV}) Z^{2}}{\mathrm{n}^{2}}$
where, for convenience, the numerical value of the combination of constants appearing in the formula has been put in units of eV .

It is fun using this formula for a neutral helium atom, but we must exercise some care. In a helium atom, each electron 'sees' the nucleus screened by the other electron. That is, the effective charge of the nucleus 'seen' by each electron decreases from its bare value $Z=2$ to some other value, say, $Z_{\text {eff }}$. The ionization energy for a helium atom in its ground state is known experimentally to be 24.46 eV . Estimate $\mathrm{Z}_{\text {eff }}$.

## B. Molecular orbitals

Molecular orbitals of a hydrogen molecule ion $\left(\mathrm{H}_{2}{ }^{+}\right)$can be approximately written as linear combinations of atomic orbitals centered around the two nuclei of the molecule. Consider the (unnormalized) molecular orbitals constructed in this manner from the 1 s and 2 s orbitals of two hydrogen atoms, say, $A$ and $B$ :

$$
\begin{aligned}
& \psi_{1}=\psi_{1 \mathrm{~s}}^{\mathrm{A}}+\psi_{1 \mathrm{~s}}^{\mathrm{B}} \\
& \tilde{\Psi}_{1}=\psi_{1 \mathrm{~s}}^{\mathrm{A}}-\psi_{1 \mathrm{~s}}^{\mathrm{B}} \\
& \Psi_{2}=\psi_{2 \mathrm{~s}}^{\mathrm{A}}+\psi_{2 \mathrm{~s}}^{\mathrm{B}} \\
& \tilde{\Psi}_{2}=\psi_{2 \mathrm{~s}}^{\mathrm{A}}-\psi_{2 \mathrm{~s}}^{\mathrm{B}}
\end{aligned}
$$

Taking the z-axis along the line joining the two nuclei, the orbital contours of $\psi_{1}$ and $\psi_{1}$ are shown schematically below :

Similar orbital contours (curves on which the value of $\psi$ is constant) can be drawn for $\psi_{2}$ and $\psi_{2}$.

The energies of these wave functions as a function of internuclear distance are shown below schematically:

a. Identify the bonding and antibonding orbitals. State qualitatively what makes one orbital bonding and another antibonding.
b. Determine the values of the equilibrium internuclear distance $R_{e}$ and the dissociation energy $D$ of the ground state of $\mathrm{H}_{2}{ }^{+}$.
c. If the molecular ion $\mathrm{H}_{2}{ }^{+}$is excited to the state $\psi_{2}$, to what atomic states will it dissociate?

In the following questions, assume that the energy versus internuclear distance graphs for the orbitals of $\mathrm{H}_{2}$ and $\mathrm{He}_{2}$ are similar to the one shown for $\mathrm{H}_{2}{ }^{+}$.
d. Explain why the ground state total electron spin of the neutral $\mathrm{H}_{2}$ molecule is zero.
e. Write down the electronic configuration of the first excited state of $\mathrm{H}_{2}$ molecule. Predict if it will stay bound or dissociate.
f. It is difficult to obtain $\mathrm{He}_{2}$ in its ground state, but it has been observed in its excited states. Explain how this is possible.

## Problem 7 Fission

a. Consider the following fission reactions of ${ }^{235} \mathrm{U}$ by thermal neutrons :

$$
\begin{aligned}
& { }_{92}^{235} \mathrm{U}+\mathrm{n} \rightarrow{ }_{38}^{94} \mathrm{Sr}+{ }_{(\ldots)}^{140} \mathrm{Xe}+(\ldots .) \\
& { }_{92}^{235} \mathrm{U}+\mathrm{n} \rightarrow{ }_{56}^{141} \mathrm{Ba}+(\ldots)+3 \mathrm{n}
\end{aligned}
$$

Identify the missing species and numbers.
b. Consider the first of the reactions above. The unstable fission fragments undergo successive $\beta$-decays giving Zr and Ce . Write down the net nuclear reaction and calculate the total energy released in MeV. You are given the following data on atomic masses :
$\mathrm{m}\left({ }^{235} \mathrm{U}\right)=235.0493 \mathrm{u}$
$m\left({ }^{94} \mathrm{Zr}\right)=93.9063 \mathrm{u}$
$\mathrm{m}\left({ }^{140} \mathrm{Ce}\right)=139.9054 \mathrm{u}$
$\mathrm{m}_{\mathrm{n}}=1.00866 \mathrm{u}$
$1 \mathrm{u}=931.5 \mathrm{MeV} / \mathrm{c}^{2}$
c. 1 kg of natural uranium metal was put in a nuclear research reactor. When the total energy released reached 1 Mega Watt Day (MWd), it was removed from the reactor. What would be the percentage abundance of ${ }^{235} \mathrm{U}$ in the uranium metal at that time, if it is $0.72 \%$ in natural uranium. Your result in b. above may be taken to be the average energy released per fission. Assume that all the energy is due to fission of ${ }^{235} \mathrm{U}$ only.

## Problem 8 Radioactive decay

The radioactive isotope ${ }^{210} \mathrm{Bi}$ is the daughter product of ${ }^{210} \mathrm{~Pb}$ and decays by $\beta$ emission to ${ }^{210} \mathrm{Po}$, which is also radioactive. ${ }^{210} \mathrm{Po}$ decays by $\alpha$-emission to the stable ${ }^{206} \mathrm{~Pb}$.
${ }^{210} \mathrm{~Pb} \underset{\mathrm{~T}_{1 / 2}=22.3 \mathrm{y}}{\stackrel{\beta}{210} \mathrm{Bi} \xrightarrow[\mathrm{T}_{1 / 2}=5.01 \mathrm{~d}]{\beta}{ }^{210} \mathrm{Po} \xrightarrow{\mathrm{T}_{1 / 2}=138.4 \mathrm{~d}}{ }^{206} \mathrm{~Pb}}$
A sample of radiochemically pure ${ }^{210} \mathrm{Bi}$ was freshly isolated from ${ }^{210} \mathrm{~Pb}$ and was allowed to stand for the growth of ${ }^{210} \mathrm{Po}$. The radioactivity of the freshly purified ${ }^{210} \mathrm{Bi}$ sample was $100 \mu \mathrm{Ci}$. ( $\mathrm{Ci}=3.7 \times 10^{10}$ disintegration per second)
a. What is the initial mass of the sample $\left({ }^{210} \mathrm{Bi}\right)$ ?
b. Calculate the time it takes for the amount of ${ }^{210} \mathrm{Po}$ in the sample to grow to its maximum value. How much is the maximum amount of ${ }^{210} \mathrm{Po}$ ?
c. Determine the $\alpha$-disintegration rate of ${ }^{210} \mathrm{Po}$ and $\beta$-disintegration rate of ${ }^{210} \mathrm{Bi}$ at that time.

## Problem 9 Redox reactions

a. A solution containing $\mathrm{Sn}^{2+}$ ions is titrated potentiometrically with $\mathrm{Fe}^{3+}$. The standard reduction potentials for $\mathrm{Sn}^{4+/ 2+}$ and $\mathrm{Fe}^{3+/ 2+}$ are given below.
$\mathrm{Sn}^{4+}+2 \mathrm{e}^{-} \rightleftharpoons \mathrm{Sn}^{2+}$
$E^{\circ}=0.154 \mathrm{~V}$
$\mathrm{Fe}^{3+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Fe}^{2+}$
$E^{\circ}=0.771 \mathrm{~V}$
i. Write down the overall reaction and calculate the standard free energy change of the overall reaction.
ii. Determine the equilibrium constant of the reaction.
b. If 20 mL of $0.10 \mathrm{M} \mathrm{Sn}^{2+}$ is titrated with $0.20 \mathrm{M} \mathrm{Fe}^{3+}$ solution, calculate the voltage of the cell
i. when 5 mL of $\mathrm{Fe}^{3+}$ solution is added.
ii. at the equivalence point.
iii. when 30 mL Fe ${ }^{3+}$ of the solution is added.

The saturated calomel electrode ( $\mathrm{E}^{\circ}$ s.c. $=0.242 \mathrm{~V}$ ) is used as the reference electrode in the titration.
c. One of the important analytical methods for estimation of $\mathrm{Cu}^{2+}$ is iodometric titration. In this reaction $\mathrm{Cu}^{2+}$ is reduced to $\mathrm{Cu}^{+}$by $\mathrm{I}^{-}$and the liberated $\mathrm{I}_{2}$ is then titrated with standard $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution. The redox reaction is as follows:
$2 \mathrm{Cu}^{2+}+4 \mathrm{I}^{-} \rightarrow \quad 2 \mathrm{Cul}_{(\mathrm{s})}+\mathrm{I}_{2(\mathrm{aq})}$
Electrode potentials of the relevant half-cells are:

| $\mathrm{Cu}^{2+}+\mathrm{e}^{-}$ | $\rightleftharpoons \mathrm{Cu}^{+}$ | $\mathrm{E}^{\circ}=0.153 \mathrm{~V}$ |
| :--- | :--- | :--- |
| $\mathrm{I}_{2}+2 \mathrm{e}^{-}$ | $\rightleftharpoons$ | $2 \mathrm{I}^{-}$ |

A consideration of the electrode potentials would indicate that reduction of $\mathrm{Cu}^{2+}$ by $\mathrm{I}^{-}$ is not a spontaneous reaction. However, in the iodometric titration this reaction does take place. Let us try to understand the anomaly:
i. Cul has low solubility in water with $\mathrm{K}_{\mathrm{sp}} \approx 1.1 \times 10^{-12}$. Calculate the effective $\mathrm{E}^{\circ}$ value for the equilibrium $\mathrm{Cul}_{(\mathrm{s})} \rightleftharpoons \mathrm{Cu}^{+}+\mathrm{I}^{-}$.
ii. Using the result in i., calculate the effective $E^{\circ}$ value for the reduction of $\mathrm{Cu}^{2+}$ by $\mathrm{I}^{-}$. What does this value suggest about the spontaneity of the reaction?
iii. Calculate the equilibrium constant of the reduction reaction in ii.

## Problem 10 Solubility of sparingly soluble salts

Two important factors that affect the solubility of a sparingly soluble salt are pH and the presence of a complexing agent. Silver oxalate is one such salt, which has low solubility in water $\left(2.06 \times 10^{-4}\right.$ at $\left.\mathrm{pH}=7.0\right)$. Its solubility is affected by pH as the anion oxalate reacts with hydronium ions, and also by a complexing agent such as ammonia as the cation silver forms complexes with ammonia.
a. Calculate the solubility of silver oxalate in acidified water with $\mathrm{pH}=5.0$. The first and second dissociation constants for oxalic acid are $5.6 \times 10^{-2}$ and $6.2 \times$ $10^{-5}$ respectively.
b. In the presence of ammonia in aqueous solution, silver ion forms two complexes $\mathrm{Ag}\left(\mathrm{NH}_{3}\right)^{+}$and $\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}$. The values of the stepwise stability constants for the formation of these complexes are $1.59 \times 10^{3}$ and $6.76 \times 10^{3}$. What is the solubility of silver oxalate in an aqueous solution that contains $0.02 \mathrm{M} \mathrm{NH}_{3}$ and has $\mathrm{pH}=10.8$ ?

## Problem 11 Spectrophotometry

a. Manganese and chromium in steel can be determined simultaneously by absorption spectral method. Dichromate and permanganate ions in $1 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ $\left(\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}\right.$ and $\mathrm{MnO}_{4}{ }^{-}$) absorb at 440 nm and 545 nm . At these wavelengths, molar absorptivity of $\mathrm{MnO}_{4}^{-}$is $95 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}$ and $2350 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}$ respectively and that of $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$ is $370 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}$ and $11 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}$ respectively.

A steel sample, weighing 1.374 g was dissolved and Mn and Cr in the resulting solution oxidised to $\mathrm{MnO}_{4}^{-}$and $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$. The solution was diluted with 1 M $\mathrm{H}_{2} \mathrm{SO}_{4}$ to 100.0 mL in a volumetric flask. The transmittances of this solution were measured with a cell of 1.0 cm path length and with $1.0 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ as blank. The observed transmittances at 440nm and 545nm respectively were $35.5 \%$ and 16.6\%

Calculate from these data the percentage of Mn and Cr in the steel sample. Assume that Beer's law is valid for each ion and that the absorption due to one ion is unaffected by the presence of the other ion .
b. Cobalt (II) forms a single complex $\mathrm{CoL}_{3}{ }^{2+}$ with an organic ligand L and the complex absorbs strongly at 560 nm . Neither Co (II) nor ligand $L$ absorbs at this wavelength. Two solutions with the following compositions were prepared:

Solution $1 \quad[\mathrm{Co}(\mathrm{II})]=8 \times 10^{-5}$ and $[\mathrm{L}]=2 \times 10^{-5}$.
Solution $2 \quad[\mathrm{Co}(\mathrm{II})]=3 \times 10^{-5}$ and $[\mathrm{L}]=7 \times 10^{-5}$.
The absorbances of solution 1 and solution 2 at 560 nm , measured with a cell of 1.0 cm path length, were 0.203 and 0.680 respectively. It may be assumed that in solution 1, all the ligand is consumed in the formation of the complex. From these data calculate the
i. molar absorptivity of the complex $\mathrm{CoL}_{3}{ }^{2+}$
ii. stability constant for the formation of the complex $\mathrm{CoL}_{3}{ }^{2+}$.

## Problem 12 Reactions in buffer medium

An organic nitro-compound $\left(\mathrm{RNO}_{2}\right)$ is electrolytically reduced in an aqueous acetate buffer solution having total acetate concentration (HOAc $+\mathrm{OAc}^{-}$) 0.500 and $\mathrm{pH}=5.0$. 300 mL of the buffered solution containing $0.01 \mathrm{M} \mathrm{RNO}_{2}$ was reduced completely. The dissociation constant for acetic acid is $1.75 \times 10^{-5}$ at $25^{\circ} \mathrm{C}$. The reduction reaction is

$$
\mathrm{RNO}_{2}+4 \mathrm{H}^{+}+4 \mathrm{e}^{-} \longrightarrow \mathrm{RNHOH}+\mathrm{H}_{2} \mathrm{O}
$$

Calculate the pH of the solution on completion of the reduction of $\mathrm{RNO}_{2}$.
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems

## Problem 13 Identification of an inorganic compound

Some observations related to an unknown inorganic substance A are presented below.

- $\mathbf{A}$ is a yellowish - white deliquescent solid and it sublimes on heating. It has a molecular weight of 266.
- A reacts violently with water, forming solution B.
- When a solution of $\mathrm{NH}_{4} \mathrm{Cl}$ and $\mathrm{NH}_{4} \mathrm{OH}$ is added to solution $\mathbf{B}$, a white gelatinous precipitate is obtained.
- A sample of $\mathbf{B}$ also gives a curdy white precipitate $\mathbf{C}$ on addition of dilute nitric acid and silver nitrate solution. This white precipitate $\mathbf{C}$ readily dissolves when dilute $\mathrm{NH}_{4} \mathrm{OH}$ is added, though a gelatinous white precipitate $\mathbf{D}$ is formed in its place with excess $\mathrm{NH}_{4} \mathrm{OH}$.
- Precipitate $\mathbf{D}$ is filtered off and is dissolved in excess NaOH to give a clear solution E.
- When $\mathrm{CO}_{2}$ is passed through solution $\mathbf{E}$, compound $\mathbf{D}$ is reprecipitated.
- Substance A dissolves unchanged in dry ether. When this solution is reacted with LiH , a product $\mathbf{F}$ is formed. If LiH is used in excess, $\mathbf{F}$ transforms to $\mathbf{G}$.
a. Identify the unknown compound $\mathbf{A}$.
b. Write down the appropriate chemical equations for the given reactions and identify the different products from $\mathbf{B}$ to $\mathbf{G}$.

## Problem 14 Ionic and metallic structures

Modern methods of structural analysis using X-rays provide valuable information about the three dimensional arrangement of atoms, molecules or ions in a given crystal structure.

## a. Crystal structure of rock salt $(\mathrm{NaCl})$ is given below.

i. What is the type of crystal lattice presented in the diagram?
ii. What is the coordination number of a sodium ion in this structure?
iii. What is the number of formula units of NaCl per unit cell?
iv. Calculate the $r^{+} / r^{-}$limiting radius ratio for this type of structure.
v. Why is the array of chloride ions slightly expanded, with the nearest $\mathrm{Cl}-\mathrm{Cl}$ distance being 400pm, compared to the close packed value of 362 pm?
vi. What happens when the cation radius in the structure shown above is progressively increased till the cation/anion radius ratio reaches a value of 0.732 ?
vii. What is the range of cation/anion radius ratio for which the structure like that of NaCl is stable?
b. The $\mathrm{Cu}-\mathrm{K}_{\alpha} \mathrm{X}-\mathrm{ray}(\lambda=154 \mathrm{pm})$ reflection from (200) planes of sodium chloride crystal is observed at $15.8^{\circ}$. Given that the radius of the chloride ion is 181 pm, calculate
i. the separation between adjacent 200 planes of NaCl .
ii. the length of the unit cell edge (lattice constant) of NaCl .
iii. the radius of the sodium ion.
c. The diagram of a cubic close packing ( $c c p$ ) and a hexagonal close packing (hcp) lattice arrangement (assuming rigid sphere model) is given below.

i. Describe the difference between the $c c p$ and $h c p$ lattice arrangements.
ii. Calculate the packing fraction for a $c c p$ arrangement.
iii. Will the coordination number and the packing fraction in a hcp arrangement be the same as that in a ccp arrangement?
d. Nickel (at.wt. 58.69) crystallizes in the ccp structure. X-ray diffraction studies indicate that its unit cell edge length is 352.4 pm . Given that the density of Nickel is $8.902 \mathrm{~g} \mathrm{~cm}^{-3}$, calculate
i. the radius of the nickel atom.
ii. the volume of the unit cell.
iii. the Avogadro number.

## Problem 15 Compounds of nitrogen

a. Nitrogen forms a number of oxides. One of the important oxides of nitrogen is $\mathrm{NO}_{2}$, a red-brown colored reactive gas.
i. Draw the Lewis structure of $\mathrm{NO}_{2}$ and predict its shape using valence shell electron pair repulsion theory.
ii. Using VSEPR, predict the shapes of the $\mathrm{NO}_{2}{ }^{-}$and $\mathrm{NO}_{2}{ }^{+}$ions. Compare the shapes of these two ions with that of $\mathrm{NO}_{2}$.
b. Consider two other compounds of nitrogen, trimethylamine $\left(\mathrm{Me}_{3} \mathrm{~N}\right)$ and trisilylamine $\left(\mathrm{H}_{3} \mathrm{Si}\right)_{3} \mathrm{~N}$. The observed bond angles at nitrogen in these compounds are $108^{\circ}$ and $120^{\circ}$ respectively. Explain the difference in the bond angles.
c. Both nitrogen and boron form trifluorides. The bond energy in $\mathrm{BF}_{3}$ is 646 $\mathrm{kJ} /$ mole and that in $\mathrm{NF}_{3}$ is only $280 \mathrm{~kJ} /$ mole. Account for the difference in bond energies.
d. The boiling point of $\mathrm{NF}_{3}$ is $-129^{\circ} \mathrm{C}$ while that of $\mathrm{NH}_{3}$ is $-33^{\circ} \mathrm{C}$. Ammonia acts as a Lewis base whereas $\mathrm{NF}_{3}$ does not. The observed dipole moment of $\mathrm{NF}_{3}$ ( 0.24 D ) is much less than that of $\mathrm{NH}_{3}(1.46 \mathrm{D})$, even though fluorine is much more electronegative than hydrogen.
i. Explain the differences between boiling points and basicities of $\mathrm{NF}_{3}$ and $\mathrm{NH}_{3}$.
ii. Account for the low dipole moment of $\mathrm{NF}_{3}$.
e. The reaction of aqueous sodium nitrate with sodium amalgam as well as that of ethyl nitrite with hydroxylamine in presence of sodium ethoxide give the same product. This product is the salt of a weak unstable acid of nitrogen. Identify the acid and write down its structure. This acid isomerises into a product, which finds use in propellant formulations. Write the structure of the isomer.

## Problem 16 Structure elucidation with stereochemistry

Citric acid (2-hydroxy-1,2,3-propanetricarboxylic acid) is the primary acid of citrus fruits, which contributes to their sour taste. Commercial manufacturing of citric acid involves fermentation of molasses or starch using the fungus Aspergillus niger at pH
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems

#### Abstract

3.5. It is widely used in food, soft drinks and as a mordant in dyeing. It is also an important biochemical intermediate.

a. What transformation will citric acid undergo when warmed with concentrated sulfuric acid at $45-50^{\circ} \mathrm{C}$ ? Give the structure and IUPAC name of the product obtained. Which type of organic acids would undergo a similar reaction?

After warming citric acid with sulfuric acid, anisole (methoxybenzene) is added to the reaction mixture and product $\mathbf{A}\left(\mathbf{C}_{12} \mathbf{H}_{12} \mathrm{O}_{5}\right)$ is obtained.

- On heating with acetic anhydride, A forms an anhydride.
- 118 mg of $\mathbf{A}$ requires 20 mL of 0.05 N KOH for neutralisation.
- Reaction with bromine indicates that the same amount of compound $\mathbf{A}$ requires 80 mg of bromine to give an addition product.
b. Deduce the structure of $\mathbf{A}$.
c. Identify the possible isomers of $\mathbf{A}$ in this reaction and give their structures, absolute configurations and the IUPAC names.
d. In the bromination reaction, how many stereoisomers of $\mathbf{A}$ will be obtained? Draw their Fischer projections.
e. Assign absolute configurations to the stereocentres in all the stereoisomers formed in d.

Instead of anisole, if phenol and resorcinol are separately added to the reaction mixture, compounds $\mathbf{B}$ and $\mathbf{C}$ are obtained, respectively. $\mathbf{B}$ does not give any coloration with neutral $\mathrm{FeCl}_{3}$, but $\mathbf{C}$ does. Under identical reaction conditions, the yield of compound $\mathbf{C}$ is much higher than that of $\mathbf{B}$.
f. Give appropriate structures for B and C.
g. What is the difference between the reactions leading to the formation of $\mathbf{A}$ and $\mathbf{B}$ ?
h. Why is the yield of $\mathbf{C}$ higher than that of $\mathbf{B}$ ?

## Problem 17 Organic spectroscopy and structure determination

The following observations were recorded for identifying two compounds $\mathbf{A}$ and $\mathbf{B}$.

Both have the molecular formula $\mathrm{C}_{3} \mathrm{H}_{6} \mathbf{O}$. Schematic ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of these compounds at 400 MHz are presented in the following figure. The peak positions and the relative intensities of the different lines in the ${ }^{1} \mathrm{H}$-NMR spectrum of $\mathbf{B}$ are given in the accompanying Table (Note: the values have been altered slightly from the experimental values to facilitate analysis.)

One of these compounds reacts with malonic acid to form a compound known as Meldrum's acid, with the molecular formula $\mathbf{C}_{6} \mathbf{H}_{8} \mathbf{O}_{4}$ which gives peaks between 0 and $7.0 \delta$ in its ${ }^{1} \mathrm{H}$-NMR spectrum. The IR spectrum shows a peak in the region 1700-1800 $\mathrm{cm}^{-1}$. It condenses with an aromatic aldehyde in the presence of a base.

## ${ }^{1} \mathrm{H}$-NMR schematic spectra of $A$ and $B$ at 400 MHz

$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
Peak positions and relative intensities of individual lines in the ${ }^{1} \mathrm{H}$ NMR spectrum ( 400 MHz ) of $B$

| Line | (ppm) | Relative <br> intensity | Line | (ppm) | Relative <br> intensity |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 6.535 | 1 | 8 | 3.870 | 1 |
| 2 | 6.505 | 1 | 9 | 3.525 | 1 |
| 3 | 6.495 | 1 | 10 | 3.505 | 1 |
| 4 | 6.465 | 1 | 11 | 3.495 | 1 |
| 5 | 3.930 | 1 | 12 | 3.475 | 1 |
| 6 | 3.910 | 1 | 13 | 3.000 | 12 |
| 7 | 3.890 | 1 |  |  |  |

a. Label the unknown compounds in the bottles with IUPAC names, using the NMR spectra given in the figure.
b. In the ${ }^{1} \mathrm{H}$-NMR spectrum of $\mathbf{B}$, assign the peak positions to specific protons.
c. Calculate the spin-spin coupling constants for protons of compound B.
d. Convert the peak positions of the first four lines into Hz (refer to theTable). What will be the peak positions of these lines in Hz , if the spectrum is recorded on a 600 MHz instrument?
e. Draw the possible structure of Meldrum's acid.
f. Meldrum's acid has $\mathrm{pK}_{\mathrm{a}}=4.83$. Explain the acidity of Meldrum's acid.
g. Give the structure of the condensation product of Meldrum's acid with an aromatic aldehyde.

## Problem 18 Polymer synthesis

Ethylene finds extensive application in the manufacture of polymers and bulk chemicals. It is produced on a large scale by thermal and catalytic cracking of alkanes obtained from natural gas and petroleum.

In the presence of silver catalyst, ethylene reacts with oxygen to give $\mathbf{P}$. Compound $\mathbf{P}$ on heating with acidified water forms $\mathbf{Q}$. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of $\mathbf{P}$ has only one signal while that of $\mathbf{Q}$ contains two signals.
a. Identify and draw the structures for compounds $\mathbf{P}$ and $\mathbf{Q}$.

Compound $\mathbf{R}$ is obtained when $\mathbf{P}$ and $\mathbf{Q}$ react with each other. $\mathbf{R}$ reacts with $\mathrm{SOCl}_{2}$ to give $\mathbf{S}$. On heating with alcoholic $\mathrm{KOH}, \mathbf{S}$ gives $\mathbf{T}$, an anaesthetic under the name "vinethene".
$\mathbf{P}+\mathbf{Q} \longrightarrow \mathbf{R} \xrightarrow{\mathrm{SOCl}_{2}} \mathbf{S} \xrightarrow{\text { alc. } \mathrm{KOH}} \mathbf{T}$
b. Identify the compounds $\mathbf{R}, \mathbf{S}$ and $\mathbf{T}$.

Another compound dimethyl benzene-1,4-bis(acetate) can be synthesised from p-xylene. Such a synthesis requires use of proper reagents so that desired intermediate compounds and the final product are obtained. Various intermediate compounds obtained in the synthesis of dimethyl benzene-1,4-bis(acetate) along with their structures are shown below.

c. Identify the reagents used in this synthesis of dimethyl benzene -1,4bis(acetate).
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
d. How many peaks would you expect in the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of dimethyl benzene $-1,4$-bis(acetate)?

When dimethyl benzene-1,4-bis(acetate) (synthesised from p-xylene) and compound $\mathbf{R}$ (obtained from ethylene) are heated together a polymer is formed.
e. Draw the structure of the polymer.
f. What happens when this polymer is treated with

- $\quad$ aq KOH (heat), then $\mathrm{H}^{+} / \mathrm{H}_{2} \mathrm{O}$ ?
- $\quad \mathrm{LiAlH}_{4}$ ?
g. Inadvertently, an excess of dimethyl benzene-1,4-bis(acetate) was heated with glycerol and a different polymer was obtained. What is the likely structure of this polymer? Will it be suitable for drawing fibres?

## Problem 19 Organic synthesis involving regioselection

One crucial problem in organic synthesis concerns the synthesis of a specific disubstituted benzene through an electrophilic substitution reaction on a monosubstituted benzene. This problem is elegantly tackled in the synthesis of Tramadol, an analgesic drug ( $\mathbf{C}_{16} \mathbf{H}_{25} \mathbf{N O}_{2}$ ), described below. The first step in this synthesis invovles :

$$
\text { Phenol } \xrightarrow[\text { halogen }]{\mathrm{HSbF}_{6}} \mathbf{A}
$$

A gives two equal intensity peaks at 172 and 174 in the highest $\mathrm{m} / \mathrm{z}$ region of its mass spectrum. It gives a mixture of three isomeric mononitro derivatives on nitration under mild conditions.
a. Draw the structure for compound $\mathbf{A}$. What is the regioselection observed in the reaction of phenol to form $\mathbf{A}$ ? State the significance of this reaction.

Consider the following reaction

$$
\mathbf{A} \xrightarrow{\left(\mathrm{CH}_{3}\right)_{2} \mathrm{SO}_{4} / \mathrm{NaOH}} \mathbf{B} \xrightarrow{\mathrm{Mg} / \mathrm{THF} / \text { toluene }} \mathbf{C}
$$

Mass spectrum of $\mathbf{B}$ shows equal intensity peaks at 186 and 188 in the highest $\mathrm{m} / \mathrm{z}$ region.
b. Give structures of compounds $\mathbf{B}$ and $\mathbf{C}$. How does the reactivity of $\mathbf{B}$ change on its conversion to $\mathbf{C}$ ?

Another intermediate compound $\mathbf{D}$ required for the synthesis of Tramadol is obtained as follows

c. Show the structures of compound $\mathbf{D}$ and the final product Tramadol.
d. Give the structures of the possible stereoisomers of Tramadol.

## Problem 20 Carbon acids

Keto esters are bifunctional reactive molecules and are important synthons for the synthesis of aliphatic and heterocyclic compounds.
a. Two isomeric keto esters $\mathbf{X}$ and Y have the same molecular formula $\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{O}_{3}$. Deduce their possible structures.

Each ester is first reacted with benzyl bromide in the presence of $\mathrm{CH}_{3} \mathrm{ONa}$, and the resulting products are treated with 1 or 2 equivalent of a strong base (such as lithium diisopropyl amide, LDA) followed by 1 equivalent of $\mathrm{CH}_{3}$ I.

The products at the end of the second step are then hydrolysed by aq. HCl .
b. Write down the reaction sequences involved.
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
c. At the end of the reaction, the final product of keto ester $\mathbf{X}$ is a neutral compound (molecular formula $\mathbf{C}_{11} \mathbf{H}_{14} \mathbf{O}$ ) whereas keto ester $\mathbf{Y}$ gives a keto acid (molecular formula $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{O}_{3}$ ). Explain.
d. Keto ester $\mathbf{X}$ gives different products depending upon the amount of LDA used. Explain what happens when
i. $\quad 1$ equivalent of LDA is used.
ii. 2 equivalents of LDA are used.

## Problem 21 Amino acids and enzymes

Amino acids are the building blocks of proteins. The presence of $-\mathrm{NH}_{2}$ and -COOH groups makes amino acids amphoteric in nature. Certain amino acid side chains in proteins are critically important for their reactivity and catalytic role. Glutamic acid is one such amino acid, whose structure is shown below.

$$
(\mathrm{pKa}=9.7)
$$

a. Why is the $\mathrm{pK}_{\mathrm{a}}$ of the $\alpha-\mathrm{COOH}$ group lower than that of the $\gamma-\mathrm{COOH}$ ?
b. Calculate the percent of $\gamma-\mathrm{COOH}$ group that remains unionized at pH
c. Glutamic acid is subjected to paper electrophoresis at $\mathrm{pH}=3.25$. Will it move towards the anode (+) or cathode (-) ? Why ?

Hydrolysis of polysaccharides like chitin, cellulose and peptidoglycan is a common biochemical process. This involves the hydrolysis of a glycosidic bond like the $\beta-1,4$ linkage shown below.

$\beta-1,4$ linkage

One such hydrolysis reaction is catalysed by lysozyme.
d. Suppose the lysozyme catalyzed reaction is performed in ${ }^{18} \mathrm{O}$ enriched water. Do you expect the ${ }^{18} \mathrm{O}$ to be incorporated into the product? If yes, where?

The pH -activity profile of lysozyme is shown in the figure

e. Explain this pH behavior in terms of two carboxylates (Asp-52 and Glu-35) present at the lysozyme active site (note : ionizable groups on the substrate are not involved). Write the ideal state of ionization at the lysozyme active site at pH 5.0.
f. The $\mathrm{pK}_{\mathrm{a}}$ of Glu-35 in lysozyme active site is 6.0 and not 4.3 as found in the free amino acid. Which of the following local effects is likely to be involved?

1. Enhanced negative charge
2. Enhanced positive charge
3. Enhanced polarity
4. Diminished polarity

Organic model reactions have helped to understand many features of enzyme catalytic mechanisms. When a reaction is made intramolecular (like the enzyme catalysts do!), rate acceleration takes place as if the apparent reactant concentration felt at the site is enormously raised. The carboxylate group assisted hydrolysis of three phenylacetates and their rate constants $(k)$ are shown below.

(2)

$\mathrm{k}_{2}=0.4 \mathrm{~s}^{-1}$
(first order)
(3)

$$
\begin{aligned}
& \mathrm{k}_{3}=20 \mathrm{~s}^{-1} \\
& \text { (first order) }
\end{aligned}
$$

g. Calculate the effective local concentration of the $\mathrm{COO}^{-}$group felt in (2) and (3) above.
h. Why do you see a higher rate in (3) than in (2) ?

## Problem 22 Coenzyme chemistry

The protective outer cell wall in bacteria has D-alanine as one of the building blocks. However, metabolically only L-amino acids are available. Bacteria make D-alanine by inverting the L-alanine. The structure of L-alanine is given below :

L-alanine

The abstraction of $\alpha$-proton from $L$-alanine and reprotonation of the resultant carbanion from the opposite side appears to be a simple process. However, it is not easy to deprotonate alanine unless its $\mathrm{NH}_{2}$ group is masked and $\mathrm{C}_{\alpha}-\mathrm{H}$ is activated as an acid.

Both these steps are brought about by the coenzyme pyridoxal phosphate (PLP) in the presence of the enzyme alanine racemase. The following observations made in certain model reactions will help you appreciate the role of PLP as the coenzyme.

Under favorable experimental conditions, benzaldehyde can be used as a reagent to racemize alanine. In other words, it can mask the amine group and activate the $\mathrm{C}_{\alpha}$ H of alanine making it more acidic.

L-alanine

D / L-alanine
a. Propose a stepwise mechanism for this base catalyzed racemisation of L-alanine involving benzaldehyde as the reagent.

Compared to benzaldehyde, PLP is a somewhat complex molecule. With the help of a few carefully designed aromatic aldehydes, good insight about the role of PLP as a coenzyme can be obtained.

A few relevant structures are presented below. Underneath each, there is an indication about its activity.

PLP (1)

(3)

Active

(5)

Active

Pyridoxal (2)
Active

(4)

Inactive

(6)

Inactive
b. Based on this information, what inferences can you draw about the structural requirements for PLP to act as a coenzyme?
c. A trivalent metal ion is actually critically needed for any of the above shown compounds to display PLP-like activity without the involvement of the enzyme. Suggest a plausible explanation for the role of the metal ion.
d. PLP is quite a versatile coenzyme. It participates in a variety of biologically important reactions. The activity of PLP is due to its functioning as an electron sink that stabilizes carbanions.

An important illustration of catalytic versatility of PLP is in the biosynthesis of the neurotransmitter gamma amino butyric acid (GABA). As shown below, GABA is made in a single step from L-glutamic acid. Suggest a mechanism explaining the role of PLP as the coenzyme in this particular reaction.

e. In yet another PLP mediated reaction, L-serine serves as a one-carbon donor in a complex process of nucleotide biosynthesis. The enzyme serine hydroxymethyltransferase degrades L-serine with the help of PLP into the simpler amino acid glycine. An important metabolic intermediate $(X)$ is obtained as the side product in this reaction. Identify the one carbon metabolic intermediate formed by analyzing its PLP based mechanism.

## Problem 23 Protein folding

The link between amino acid sequence of a protein (the primary structure) and its precise three-dimensional fold (the tertiary structure) remains one of the most important unsolved mysteries of modern science.

All protein backbones are identical: planar amide units are linked via tetrahedral methylene bridges, the so called $\alpha$-carbons. Each $\alpha$-carbon carries an R group of a specific $\alpha$-amino acid (see the following diagram).

A unique sequence of amino acids characterizes a particular protein, determining how it folds and functions.
a. Every amide group in the polypeptide backbone, including its flanking $\alpha$ carbons, is a planar unit. Explain.
b. The $\alpha$-carbons across each amide unit occur in a trans geometrical arrangement. However, in case of the amino acid proline, both cis and trans amide arrangements are almost equally favored. Why?
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
c. The conformational choices of amino acid residues in a polypeptide chain are stereochemically controlled. For nineteen of the genetically coded amino acids, the conformational choice is largely restricted to the $\alpha$ (folded) and $\beta$ (extended) regions of the Ramachandran diagram. For the amino acid glycine, however, the conformational choices are much wider. Explain.
d. When a linear polypeptide folds forming a globular protein, an amino acid residue may assume $\alpha$ or $\beta$ conformation. However it is observed that consecutive residues generally assume $\alpha$ or $\beta$ conformation, rather than a random combination of $\alpha$ and $\beta$. Explain.
e. In an aqueous environment polypeptides generally fold into compact globular protein structures. The reason is (select one) :

1. The R groups in polypeptides are largely polar.
2. The $R$ groups in polypeptides are largely nonpolar.
3. Both polar and nonpolar R groups occur in comparable proportion.

Justify your answer.
f. The pattern of $R$ group polarities has an important role in determining whether $\alpha$-helix or $\beta$-sheet will form when a polypeptide folds in water at an apolar surface. Explain the role of $R$ group polarities.

## Problem 24 Protein sequencing

Sequencing of a protein (polypeptide) involves the following steps: a) purification, (b) determination of N -terminal amino acid, (c) cleavage of the polypeptide chain by chemical or enzymatic methods, (d) isolation of the peptide fragments and (e) determination of their sequence by an automated sequencing machine (sequenator). It is also possible to sequence the mixture of peptide fragments without resolving it.

The final sequence can be determined by constructing overlapping sequences after analyzing the information on the positional data on amino acids in different fragments.

A small protein made up of 40 amino acid residues was sequenced as follows :

- Edman degradation involves treatment with phenyl isothiocyanate, subsequent hydrolysis and spectrophotometric identification of the modified amino acid. This procedure identified aspartic acid (Asp) as the N -terminal residue.
- The protein was cleaved with CNBr (cyanogen bromide) which cleaves the peptide bond between methionine and any other amino acid on its C-terminal side. The resulting peptide fragments were not separated. This mixture of peptides was analyzed on the protein sequenator. Therefore, the sequenator would detect as many amino acids in the given position as the number of fragments. The results are shown in Table 1(a).
- The protein was digested with a proteolytic enzyme trypsin. This enzyme cleaves the peptide bond between a basic amino acid (Arg or Lys) and the next Cterminal residue. The resulting mixture of peptides was also analyzed as above. The results are shown in Table 1(b).

Given this information:
a. Deduce the amino acid sequence common to the first fragment (N-terminal) obtained by CNBr and trypsin treatments.
b. Deduce the sequence of the first fragment generated by CNBr treatment.
c. Deduce the entire sequence in the original polypeptide. Indicate the CNBr labile and trypsin-labile sites in this sequence.
d. What percentage of the total residues are basic amino acids?
e. If the polypeptide were to exist as an $\alpha$ helix, what will be the length of this $\alpha$ helical structure?

## Table 1. Data from protein sequenator .

| Treatment | Position number |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| a) CNBr: <br> (Met) | Arg <br> Asp <br> Glu <br> Gly | $\begin{aligned} & \hline \text { Gln } \\ & \text { Pro } \\ & \text { Thr } \\ & \text { Tyr } \end{aligned}$ | Asn <br> Pro <br> Ser <br> Tyr | Arg <br> His <br> Ilu <br> Val | Asn <br> Ilu <br> Leu <br> Phe | Arg <br> His <br> Trp <br> Val | Ala <br> Gly <br> Phe <br> Thr | Ala Lys <br> Met <br> Tyr |
| b) Trypsin: <br> (Arg or Lys) | Asp <br> Gly <br> Gly <br> Phe <br> Tyr | Cys <br> His <br> Pro <br> Pro <br> Tyr | His <br> Met <br> Thr <br> Tyr | Ala <br> Asn <br> Glu <br> Val | Ilu <br> Leu <br> Thr <br> Trp | Arg <br> Phe <br> Ser <br> Ser | Cys <br> Lys <br> Ilu | Glu <br> Leu |

f. What will be the size of the DNA segment (exon) coding for this polypeptide of 40 amino acids? Give the size in base pairs as well as in daltons. (consider average molecular weight of a nucleotide in DNA $=330$ ).
g. Assuming that the DNA corresponding to the exon contains equal numbers of Adenine and Cytosine, calculate the number of H -bonds which will hold this double helix.

## Practical Problems

## Safety Regulations

The following regulations apply to all laboratories used for the Olympiad. Participating students must be well acquainted with these regulations and should study them seriously. These rules will be strictly followed in the $33^{\text {rd }} \mathrm{IChO}$ practical examination. Students who break any of these rules will be given only one warning before they are disqualified from the practical examination.

If any questions arise concerning safety procedures during the practical examination, students should not hesitate to ask the nearest instructor for directions.

All students are required to sign a statement agreeing that they have read and understood the rules prior to the examination.

## Rules for personal safety

a. For eye protection, safety goggles must be worn in the laboratories at all times. If the student wears contact lenses, full protection goggles, which provide total seal around eyes, must be worn. All students are requested to bring their safety goggles, but we shall have some in reserve.
b. A long sleeved, knee length laboratory coat is recommended. Long pants and closed-toed shoes must be worn for individual safety. Loose clothing, open style shoes and sandals are prohibited. Long hair must be contained. Each student will have to get her/his own necessary items for herself/himself.
c. Prior to the examination, the demonstrator-in-charge will check all protective equipments to ensure that they are in order.
d. Pipetting by mouth is strictly forbidden.
e. Eating, drinking or smoking in the laboratory is strictly prohibited.

## Accidents and first aid

In any chemistry laboratory, accidents can take place due to spillage of chemicals, broken glasswares and fire. Any injury, illness, or incident, however minor, must be reported to the instructor immediately so that proper corrective action can be taken up.
a. Chemicals: Every chemical in the laboratory must be handled with utmost care. Chemicals can be corrosive, flammable or poisonous. Each student should read the safety notes related to the chemicals given in the task before handling them. The following general precautions must be always followed in the laboratory :

- Chemicals should never be tasted. Use pipette bulbs or pipette fillers all the time.
- Spillage on the skin: For any spillage of chemicals, the first step is to flush the skin under cold tap water for 10 to 15 minutes and then seek first aid/or medical help as appropriate. Organic materials tend to get absorbed on the skin, so wash the skin with warm water and soap, after cleaning it with cold water. Contaminated clothing should be removed at the earliest.
- Chemicals in the eye: The proper use of safety goggles will reduce the risk of any eye injury. Even so, if there is any splash of chemicals into the eyes, wash your eyes with cold water for 15 minutes and then look for appropriate medical attention.
b. Fire: Many chemicals are flammable, and hence no open flames are permitted when such chemicals are in use. You should get familiar with the location of the nearest fire extinguisher and fire blanket.
c. Glassware: Glass is a very hard but brittle material, and can break under stress or strain. Please handle the glasswares very carefully. If breakage occurs it is essential that any particles or splinters, specially from the wounds, are removed at the earliest. The injuries must be inspected by the demonstrator-in-charge.

Please report and clean up any breakage of the glassware. Necessary replacements can be obtained from the instructor.
d. Waste Materials: Do not dispose of chemicals in the sink. Please follow all disposal rules provided in the task notes. Waste collection containers will be provided wherever necessary.
e. Care of Benches and Apparatus: Each student is responsible for her/his section of the bench. Any spillage of chemicals or water must be wiped immediately. Concentrated acid spills must be first neutralized with sodium bicarbonate and then washed with plenty of water. Your working area must be kept clean at all times. Chemicals spilled on the ground must be washed and broken glassware must be swept off immediately. Mops, brooms, dust-pans etc will be available from the preparation room.

## Some important information regarding the $33^{\text {rd }}$ IChO practical examination

> Time duration for the practical examination would be four and a half hours instead of five hours.
> The examination may consist of three independent experimental tasks. The time duration for each task may vary from one to one and a half hour.
> The examination will be conducted in two batches. Students No. 1 and 2 from each team will be part of the first batch; students No. 3 and 4 will be part of the second batch.
> Students of both batches will get a new set of apparatus for the examination.
> The apparatus for the examination will include both plasticware and glassware.
> The examination will not involve use of microscale apparatus.

## Problem 25 Determination of aspirin in the given sample

Acetyl salicylic acid $\left(\mathrm{CH}_{3} \mathrm{COO} . \mathrm{C}_{6} \mathrm{H}_{4} . \mathrm{COOH}\right)$ undergoes hydrolysis when boiled gently with aqueous NaOH , which forms a basis for its estimation.

## Chemicals and solutions

- Plain aspirin tablets
- 0.1 M Hydrochloric acid
$\mathbf{R}: 34,37 \quad \mathbf{S}: 26,45$
- 1 M Sodium hydroxide

R:35
S:2,26, 37, 39

- Borax(AR Grade)

S: 22, 24, 25

- Phenol red indicator

## Preparation of $0.1 \mathbf{M ~ H C l}$ solution

9 mL of concentrated HCl is diluted to 1000 mL using freshly prepared distilled water in a standard volumetric flask.

## Preparation of 1 M NaOH solution.

Weigh rapidly approximately 10.5 g of NaOH in a small beaker. Dissolve it in minimum amount of distilled water. Transfer the solution in a 250 mL flask and dilute the solution using boiled out distilled water.

## Procedure

## Standardisation of HCl

Weigh 0.15 g of Borax accurately and transfer it quantitatively in a clean 250 mL conical flask ; add 50 mL of distilled water to the flask. Titrate the resulting solution with HCl , using methyl red indicator until the colour changes from yellow to red.

Calculate the concentration of the HCl solution.

## Blank titration

Dilute the 25 mL of 1 M NaOH solution in a 250 mL standard flask using freshly boiled distilled water. Pipette out 25 mL of the diluted NaOH solution and titrate it against the HCl solution using phenol red as indicator until the colour changes from red to yellow.

## Titration of sample aliquot

Weigh accurately about 1.5 g of the crushed tablet sample and transfer it quantitatively in a 250 mL beaker. Add 25 mL of 1 M NaOH solution with the help of pipette and swirl the content. Boil the mixture gently on a water bath for 15 min and then cool the solution. Transfer the solution to a 250 mL standard flask. Dilute the solution up to the mark with distilled water and mix well. Titrate 25 mL of the diluted solution against the standardised HCl solution using phenol red indicator until the colour changes from red to yellow.

> Write down the appropriate chemical reaction for hydrolysis of acetyl salicylic acid.

> Calculate the percentage of aspirin in the sample.

## Problem 26 Synthesis of 1-phenyl-azo-2-naphthol $\left(\mathrm{C}_{16} \mathrm{H}_{12} \mathrm{ON}_{2}\right)$

Reactions

Benzene Diazonium Chloride Salt

Sudan-1
(1-phenyl-azo-2-napthol)
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems

## Chemicals and solutions

- Aniline
$\mathbf{R}: \mathbf{2 3}, \mathbf{2 4}, \mathbf{2 5}, 33 \mathbf{S}: \mathbf{2 8}, 36,37,45$
- Concentrated HCl

R:34, 37
$S: 26,45$

- Solid Sodium Nitrite

R: 8, 25
S:44

- $\beta$ - naphthol

R: 20, 22
S: 24, 25

- Ethyl Alcohol
- Urea

S : 22, 24, 25

- Sodium Hydroxide

R:35
S:2,26,37, 39

## Preparation of diazonium salt

Take 1 mL of aniline in a clean 50 mL beaker. Add approximately 5 mL of distilled water to aniline. Place the beaker in an ice-bath. Slowly add 2.5 mL of conc. HCl . Stir the solution with a glass rod to obtain a clear solution. Cool this solution in the ice-bath.

Weigh accurately 0.5 g of sodium nitrite $\left(\mathrm{NaNO}_{2}\right)$ and transfer it quantitatively in a 15 (or 25) mL test tube. Add 5 mL of distilled water (to the test tube) to dissolve $\mathrm{NaNO}_{2}$. Cool the resulting $\mathrm{NaNO}_{2}$ solution in an ice-bath.

Allow both the solutions to attain $0^{\circ} \mathrm{C}$ temperature. Add sodium nitrite solution in a dropwise manner to the aniline solution with continuous stirring. (During addition, the temperature of the reaction mixture should not rise above $10^{\circ} \mathrm{C}$.)

The presence of excess nitrous acid in the reaction mixture is checked using starch iodide paper.

To decompose the excess nitrous acid formed, add a small portion of solid urea. The solution is then filtered. The filtrate contains the diazonium salt.

## Coupling reaction

Weigh 0.75 g of powdered $\beta$-naphthol in a 50 mL beaker. Add 5 mL of $10 \% \mathrm{NaOH}$ solution and 5 mL of distilled water to the beaker. Stir well with glass rod to obtain a clear solution. This solution is also cooled in an ice-bath to $0^{\circ} \mathrm{C}$.

The ice cooled filtrate containing diazotised salt is added dropwise to the ice cooled solution of $\beta$-naphthol with constant stirring. At this stage, an orange-red dye will start precipitating. After the addition of the solution is complete, filter the dye using buchner funnel. Cold water is used for washing the precipitate. Dry the product and record the yield.

## Determination of melting point

Recrystallise a small portion of the organic dye prepared using ethyl alcohol. Gently heat the solution in a water bath (careful!) to dissolve the dye. Filter the hot solution. Cool the filtrate and filter the recrystallised product using Buchner funnel and suction.

Record the weight of the crude product
Record the melting point of the recrystallised product.

## Problem 27 Determination of calcium in a sample solution

Reaction

Chemical and solutions

- Sample solution containing calcium R:36

S: 22, 24
(prepared from A.R. grade $\mathrm{CaCl}_{2}$ )

- Patton and Reeders indicator
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
- KOH solution.
R:35
S: 26, 37, 39, 45
- EDTA disodium salt
$\mathbf{R}: 36,37,38 \mathbf{S}: 26,36$

## Preparation of 0.01 M EDTA:

Weigh 1.861 g of $A R$ grade $\mathrm{Na}_{2} E D T A$ and quantitatively transfer the same to 500 mL volumetric flask. Add distilled water to the flask to dissolve $\mathrm{Na}_{2} \mathrm{EDTA}$ and make up the solution to 500 mL mark with distilled water.

## Procedure

Dilute the given sample solution to 100 mL in a 100 mL volumetric flask using distilled water. Pipette out 25 mL of the diluted sample solution in a clean conical flask. Add 25 mL of distilled water and adjust the pH using freshly prepared KOH solution to 12. Check the pH with pH paper. Add a pinch of solid indicator and titrate with $\mathrm{Na}_{2}$ EDTA solution till the colour changes from wine red to blue.

## > Calculate the amount of calcium in mmoles in 100 mL of the diluted sample solution

## Problem 28 Estimation of methyl ketone by back titration

Methyl ketones like acetone can be estimated by iodinating with excess of standard iodine in an alkaline medium. The unreacted iodine is then back titrated with standard sodium thiosulphate solution.

## Chemicals and solutions

- 0.1 N lodine solution
R : 20, 21
S:23, 25
- 0.1 N NaOH
R: 35
S:2,26,37, 39
- Concentrated HCl
R:34, 37
S: 26, 45
- $1 \mathrm{NH}_{2} \mathrm{SO}_{4}$.
R : 35
S:2,26, 30
- $0.1 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$
S:22, 24, 25

## Preparation of $0.1 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ :

Weigh 25 g of AR grade $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and quantitatively transfer it to a 1 L volumetric flask. Prepare the solution using freshly boiled distilled water. Add 3 drops of chloroform while preparing the solution. Avoid exposure to light.

## Preparation of $0.1 \mathrm{~N} \mathrm{I}_{2}$ solution

Dissolve 20 g of iodate-free potassium iodide in $30-40 \mathrm{~mL}$ of distilled water in a 1 L volumetric flask. Weigh 12.7 g iodine and quantitatively transfer to the concentrated potassium iodide solution. Shake the flask well until all the iodine dissolves and then dilute up to the mark with distilled water.

## Procedure

## Standardisation of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$

Weigh out accurately 0.14 to 0.15 g of dry potassium iodate. Dissolve it in 25 mL of distilled and freshly boiled water and add 2 g of iodate free potassium iodide. Add 5 mL of 1 N sulphuric acid. Titrate the liberated iodine with thiosulphate solution with constant shaking. When the colour of the solution is pale yellow add 200 mL of distilled water and 2 mL of starch indicator. Continue the titration until the colour changes from blue to colourless.

## Determination of ketone

Weigh accurately 0.2 g of the given acetone sample in a clean 50 mL beaker and add minimum amount of distilled water. Transfer the acetone solution to a 250 mL standard volumetric flask. Add distilled water to the flask to prepare acetone solution in water and make up the solution to 250 mL mark with distilled water. Pipette out 10 mL of the acetone solution in a clean conical flask. Add 10 mL of $10 \%$ aqueous sodium hydroxide, and stopper the flask. Shake the flask for 10 min . At the end of 10 minutes, add 35 mL of 0.1 N lodine solution from the burette. Swirl the content, preferably using magnetic stirrer for 5 minutes, and keep it standing for 15 minutes.

Yellow crystals of iodoform will appear. Acidify the solution with $\mathrm{H}_{2} \mathrm{SO}_{4}$ (check the pH with pH paper).

Titrate the solution against the standardised sodium thiosulphate using starch indicator.

Write down the appropriate chemical reactions for iodination of acetone.

Calculate the amount of acetone in the given sample solution.

## Problem 29 Determination of phenol in the given sample.

## Reactions

$\mathrm{KBrO}_{3}+5 \mathrm{KBr}+6 \mathrm{HCl} \rightarrow 6 \mathrm{KCl}+3 \mathrm{H}_{2} \mathrm{O}+3 \mathrm{Br}_{2} \uparrow$
$\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}+3 \mathrm{Br}_{2} \rightarrow \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{OHBr}_{3}+3 \mathrm{HBr}$
$3 \mathrm{Br}_{2}+6 \mathrm{KI} \rightarrow 6 \mathrm{KBr}+3 \mathrm{I}_{2} \uparrow$
$6 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}+3 \mathrm{I}_{2} \rightarrow 3 \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}+6 \mathrm{NaI}$

## Chemicals and solutions

- 0.3 g phenol
R : 24, 25, 34
S:2, 28, 44
- $0.02 \mathrm{M} \mathrm{KBrO}_{3}$
R:9
S:24, 25, 27
- $3 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$
R: 35
S:2, 26, 30
- KBr
- KI

S:22,24, 25

- $1 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$

S : 24, 25, 28

- Starch indicator.

## Preparation of $0.1 \mathrm{M} \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$

Weigh 25 g of AR grade $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ in a small beaker. Quantitatively transfer it to a 1 L volumetric flask. Prepare the solution using freshly boiled distilled water. Add 3 drops of chloroform while preparing the solution. Avoid exposure to light.

## Standardisation of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$

Weigh out accurately 0.14 to 0.15 g of dry potassium iodate. Dissolve it in 25 mL of fresh, boiled distilled water and add 2 g of iodate free potassium iodide. Add 5 mL of 1 N sulphuric acid. Titrate the liberated iodine with thiosulphate solution with constant shaking. When the colour of the solution is pale yellow add 200 mL of distilled water and 2 mL of starch indicator. Continue the titration until the colour changes from blue to colourless.

## Procedure

Dissolve the given sample of phenol to 250 mL with distilled water. Take 25 mL of the phenol solution into 250 mL stoppered conical flask. Add 25 mL of standard potassium bromate solution and 0.5 g of potassium bromide. Add 5 mL of 3 M sulphuric acid. Stopper the flask immediately. Mix the reagents and let them stand for 15 min (avoid exposure to light). Then, add 2.5 g of potassium iodide rapidly. Restopper the flask immediately and swirl the contents of the flask to dissolve the solid.

Titrate the liberated iodine with standard $0.1 \mathrm{M} \mathrm{Na} \mathrm{Na}_{2} \mathrm{O}_{3}$ from the burette using starch indicator.
> Calculate the amount of phenol per 250 mL of the solution.

## Problem 30 Determination of amount of Fe (III) present in the given sample

Fe (III) in the sample solution is first reduced to Fe (II) in HCl medium using stannous chloride. Excess of stannous chloride is oxidized by addition of mercury (II) chloride. The $\mathrm{Fe}(\mathrm{II})$ is then titrated with standard potassium dichromate solution.

## Chemicals and solutions

- Sample solution
- $0.1 \mathrm{~N} \mathrm{~K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ solution
- Equimolar $\mathrm{H}_{2} \mathrm{SO}_{4}$ \&
$\mathrm{H}_{3} \mathrm{PO}_{4}$ acid mixture
- Conc. HCl
- $5 \% \mathrm{HgCl}_{2}$
- $3 \% \mathrm{SnCl}_{2}$ solutions
- Diphenylamine indicator.

R : 23, 24, 25, 33

## Note : $\mathrm{NH}_{4} \mathrm{Fe}\left(\mathrm{SO}_{4}\right)_{2} .12 \mathrm{H}_{2} \mathrm{O}$ is used to prepare the sample solution

## Preparation of $0.1 \mathrm{~N} \mathrm{~K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ solution

Weigh accurately 1.225 g of pure $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ and transfer it to a 250 mL volumetric flask. Prepare the solution using distilled water.

## Procedure:

Dilute the given Fe (III) sample solution to 100 mL using the standard volumetric flask. Take 10 mL of the diluted sample solution in a clean conical flask. Add 2 mL of concentrated HCl and boil the solution. To the hot solution, add $\mathrm{SnCl}_{2}$ solution dropwise till the reaction mixture becomes colourless. Add 2-3 drops of $\mathrm{SnCl}_{2}$ in excess.

Cool the solution under tap water. Add 2 to 3 mL of $\mathrm{HgCl}_{2}$ solution at once. A white precipitate is obtained at this stage. (If grey precipitate is obtained, reject the sample and start again.)

Add 2 to 3 mL of the acid mixture and 1 drop of the diphenylamine indicator and titrate it against $\mathrm{K}_{2} \mathrm{Cr}_{2} \mathrm{O}_{7}$ solution. Continue the titration until a colour change from colourless to permanent blue or violet is observed.

```
Write down the appropriate chemical reactions .
> Calculate the amounts of Fe (III) and NH4Fe (SO4) 2 12H2O per 100 mL
    of the sample solution.
```

## Worked Solutions to Problems

## 1. Water

## A. Phase diagram

a. The three phases of water coexist in equilibrium at a unique temperature and pressure (called the triple point):

$$
\mathrm{T}_{\mathrm{tr}}=273.16 \mathrm{~K}=0.01^{\circ} \mathrm{C} \quad \mathrm{P}_{\mathrm{tr}}=6.11 \times 10^{-3} \mathrm{bar}
$$

b. If pressure decreases, boiling point decreases, but melting point increases (slightly).
c. Beyond this point, there is no distinction between liquid and vapour phases of water. Put alternatively, it is possible to have liquid to vapour transition by a continuous path going around the critical point. (In contrast, solid-liquid transition is discontinuous.)
d. $\quad T=300 \mathrm{~K}, \quad \mathrm{P}=12.0 \mathrm{bar}$ : liquid phase
$\mathrm{T}=270 \mathrm{~K}, \quad \mathrm{P}=1.00$ bar : solid phase
e. Below $P=6.11 \times 10^{-3}$ bar, ice heated isobarically will sublimate to vapour.
f. If $x_{l}$ and $x_{v}$ are the mole fractions of water in liquid and vapour phases,
$V=x_{1} \bar{V}_{1}+x_{v} \bar{V}_{v}=x_{1} \bar{V}_{1}+\left(1-x_{1}\right) \bar{V}_{v}$
$\therefore \quad x_{1}=\frac{\bar{V}_{v}-V}{\overline{\mathrm{~V}}_{v}-\bar{V}_{1}}=4.6 \times 10^{-1}$
$\frac{V_{1}}{V}=\frac{x_{1} \bar{V}_{1}}{V}=0.140$
$\frac{V_{v}}{V}=1-0.14=0.860$

## B. Clausius - Clapeyron equation

a. $\quad \frac{d P}{d T}=\frac{\Delta \bar{H}}{T \overline{\Delta V}}$
$\Delta \overline{\mathrm{H}}=$ molar enthalpy change in phase transition
$\Delta \overline{\mathrm{V}}=$ molar change in volume in phase transition.

For ice-liquid water transition :

```
\(\Delta \overline{\mathrm{H}}>0 \quad \Delta \overline{\mathrm{~V}}<0\), since ice is less dense than water.
\(\therefore \quad \frac{\mathrm{dP}}{\mathrm{dT}}<0\)
```

Since $|\Delta \overline{\mathrm{V}}| \quad$ is not large, the P-T curve for this transition is steep, with a negative slope. Thus decrease of pressure increases the melting point slightly.

For liquid water - vapour transition

$$
\begin{aligned}
& \Delta \overline{\mathrm{H}}>0 \\
& \therefore \quad \frac{\mathrm{dP}}{\mathrm{dT}}>0
\end{aligned}
$$

Decrease of pressure decreases the boiling point.
b. Clausius - Clapeyron equation for (solid) liquid - vapour transition is
$\frac{d P}{d T}=\frac{P \Delta \bar{H}_{\text {vap }}}{R T^{2}}$
This equation follows from the Clapeyron equation under the assumptions:

1. Vapour follows ideal gas law.
2. Molar volume of the condensed phase is negligible compared to molar volume of vapour phase.
3. If further $\Delta \overline{\mathrm{H}}_{\text {vap }}$ is assumed to be constant (no variation with T ), the eq. is integrated to give
$\ln \frac{P_{2}}{P_{1}}=\frac{\Delta \bar{H}_{\text {vap }}}{R}\left(\frac{1}{T_{1}}-\frac{1}{T_{2}}\right)$

$$
\begin{array}{ll}
\text { Here } \mathrm{P}_{1}=1.01 \mathrm{bar}, & \mathrm{~T}_{1}=373.15 \mathrm{~K} \\
\mathrm{~T}_{2}=393.15 \mathrm{~K} & \Delta \overline{\mathrm{H}}_{\text {vap }}=40.66 \mathrm{~kJ} \mathrm{~mol}^{-1} \\
\mathrm{R}=8.31 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} & \\
\therefore \quad \mathrm{P}_{2}=2.01 \mathrm{bar} &
\end{array}
$$

The estimate is based on assumptions 1, 2 and 3.
c. For ice - liquid water equilibrium, use Clapeyron equation

At $\mathrm{T}_{1}=273.15 \mathrm{~K}, \mathrm{P}_{1}=1.01 \mathrm{bar}$

1. Assume that for a small change in $T, \frac{\Delta \overline{\mathrm{H}}}{\Delta \overline{\mathrm{V}}}$ is constant.

Integrating the Clapeyron equation above

$$
\begin{gathered}
\mathrm{P}_{2}-\mathrm{P}_{1}=\frac{\Delta \overline{\mathrm{H}}}{\Delta \overline{\bar{V}}} \ln \left(\frac{\mathrm{~T}_{2}}{\mathrm{~T}_{1}}\right) \\
\mathrm{T}_{2}=272.95 \mathrm{~K}, \quad \Delta \overline{\mathrm{H}}_{\text {(tusion) }}=6008 \mathrm{Jmol}^{-1}
\end{gathered}
$$

$$
\begin{aligned}
& \Delta \overline{\mathrm{V}}=\left(\frac{1}{1.00}-\frac{1}{0.917}\right) \times 18.015=-1.63 \times 10^{-6} \mathrm{~m}^{3} \mathrm{~mol}^{-1} \\
& \mathrm{P}_{2}-\mathrm{P}_{1} \quad=27 \mathrm{bar} \\
& P_{2}=28 \mathrm{bar}
\end{aligned}
$$

The estimate is based on assumption 1.

## C. Irreversible condensation

a. On the P-T plane, this equilibrium state is a solid phase (ice). Water in liquid phase at this temperature and pressure is not an equilibrium state - it is a supercooled state that does not lie on the given P -T plane.
b. Treating the metastable state as equilibrium state, we can go from the supercooled liquid state to the solid state at the same temperature and pressure by a sequence of 3 reversible steps.

1. Supercooled liquid at $-12.0^{\circ} \mathrm{C}$ to liquid at $0^{\circ} \mathrm{C}$
$\mathrm{q}_{1}=$ number of moles $\times \overline{\mathrm{C}}_{\mathrm{p}}$ (liquid water) x change of temperature

$$
\frac{28.5 \mathrm{~g}}{18.015 \mathrm{~g} \mathrm{~mol}^{-1}} \times 76.1 \mathrm{JK}^{-1} \mathrm{~mol}^{-1} \times 12.0 \mathrm{~K}=1445 \mathrm{~J}
$$

2. liquid at $0^{\circ} \mathrm{C}$ to ice at $0^{\circ} \mathrm{C}$
$\mathrm{q}_{2}=28.5 \mathrm{~g} \times(-333.5) \mathrm{Jg}^{-1}=-9505 \mathrm{~J}$
3. Ice at $0^{\circ} \mathrm{C}$ to ice at $-12.0^{\circ} \mathrm{C}$
$\mathrm{q}_{3}=$ number of moles $\times \overline{\mathrm{C}}_{p}$ (liquid water) $\times$ change of temp.

$$
\begin{aligned}
& =\frac{28.5}{18.015 \mathrm{~g} \mathrm{~mol}^{-1}} \times 37.15 \mathrm{JK}^{-1} \mathrm{~mol}^{-1} \times(-12.0 \mathrm{~K}) \\
& =-705.3 \mathrm{~J}
\end{aligned}
$$

$$
\therefore \quad \mathrm{q}=\mathrm{q}_{1}+\mathrm{q}_{2}+\mathrm{q}_{3}=-8765 \mathrm{~J}
$$

Since all the steps are at the constant pressure of 1.00 bar,

$$
\mathrm{q}=\Delta \mathrm{H}
$$

But $\Delta \mathrm{H}$ is independent of the path, i.e., it depends only on the end points.
Thus for the irreversible condensation of supercooled liquid to ice
$\mathrm{q}=\Delta \mathrm{H}=-8765 \mathrm{~J}$
c. The actual irreversible path between the two end states of the system is replaced by the sequence of three reversible steps, as above. For each reversible step, $\Delta \mathrm{S}$ can be calculated.

$$
\begin{aligned}
\Delta \mathrm{S}_{1} & =\mathrm{n} \int_{\mathrm{T}_{1}}^{\mathrm{T}_{2}} \frac{\overline{\mathrm{C}}_{\mathrm{p}}}{\mathrm{~T}} \mathrm{dT}=\mathrm{n} \overline{\mathrm{C}}_{\mathrm{p}} \ln \frac{\mathrm{~T}_{2}}{\mathrm{~T}_{1}} \\
\Delta \mathrm{~S}_{1} & =\frac{28.5 \mathrm{~g}}{18.015 \mathrm{~g} \mathrm{~mol}^{-1}} 76.1 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \times \ln \frac{273.15}{261.15} \\
& =5.41 \mathrm{~J} \mathrm{~K}^{-1}
\end{aligned}
$$

$$
\begin{aligned}
& \Delta \mathrm{S}_{2}=\frac{\Delta \mathrm{H}_{2}}{\mathrm{~T}}=\frac{-9505}{273.15}=-34.79 \mathrm{JK}^{-1} \\
& \begin{aligned}
\Delta \mathrm{S}_{3} & =\frac{28.5 \mathrm{~g}}{18.015 \mathrm{~g} \mathrm{~mol}^{-1}} 37.15 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \ln \frac{261.15}{273.15} \\
& =-2.64 \mathrm{~J} \mathrm{~K}^{-1} \\
\Delta \mathrm{~S}_{\text {system }} & =\Delta \mathrm{S}_{1}+\Delta \mathrm{S}_{2}+\Delta \mathrm{S}_{3}=-32.02 \mathrm{~J} \mathrm{~K}^{-1} \\
\Delta \mathrm{~S}_{\text {sur }} & =\frac{\mathrm{q}_{\text {sur }}}{\mathrm{T}_{\text {sur }}}=\frac{8765}{261.15}=33.56 \mathrm{JK}^{-1} \\
\Delta \mathrm{~S}_{\text {univ }} & =\Delta \mathrm{S}_{\text {system }}+\Delta \mathrm{S}_{\text {sur }}=1.54 \mathrm{JK}^{-1}
\end{aligned}
\end{aligned}
$$

The entropy of the universe increases in the irreversible process, as expected by the Second Law of Thermodynamics.

## 2. van der Waals gases

a. For a van der Waals gas

$$
Z=\frac{P V}{n R T}=1+\frac{b P}{R T}-\frac{n a}{V R T}+\frac{n^{2} a b}{V^{2} R T}
$$

The ratio of the magnitudes of the second and third terms on the right side is :
$\frac{\mathrm{b}}{\mathrm{na}} \mathrm{PV} \approx \frac{\mathrm{b}}{\mathrm{a}} \mathrm{RT}$, taking $\mathrm{PV}=\mathrm{nRT}$ up to zeroth order.
The ratio of the magnitudes of the fourth and third terms on the right side is :
$\frac{\mathrm{nb}}{\mathrm{V}} \approx \frac{\mathrm{bP}}{\mathrm{RT}}$
i. From the ratios above, it follows that at sufficiently high temperature for any given pressure, the second term dominates the third and fourth terms. Therefore,
$Z \cong 1+\frac{b P}{R T}>1$
For small $P, Z$ nearly equals unity.
ii. At lower temperatures, the third term can be greater (in magnitude) than the second term. It may be greater (in magnitude) than the fourth term also, provided $P$ is not too large. Since the third term has a negative sign, this implies that $Z$ can be less than unity.
iii. For $\mathrm{a}=0$

$$
Z=1+\frac{b P}{R T}
$$

which shows that $Z$ increases linearly with $P$.
b. Helium has negligible value of a. Graph (1) corresponds to He and (2) corresponds to $\mathrm{N}_{2}$.
c. Above $T>T_{c}$, only one phase (the gaseous phase) exists, that is the cubic equation in $V$ has only one real root. Thus isotherm (2) corresponds to $T<T_{c}$.
d. $\quad$ At $T=T_{c}$, the three roots coincide at $V=V_{c}$ This is an inflexion point.

$$
\left.\frac{d P}{d V}\right|_{V_{c}}=\left.\frac{d^{2} P}{d^{2}}\right|_{V_{c}}=0
$$

The first condition gives

$$
\begin{equation*}
\frac{\mathrm{RT}_{\mathrm{c}}}{\left(\mathrm{~V}_{\mathrm{c}}-\mathrm{nb}\right)^{2}}=\frac{2 \mathrm{na}}{\mathrm{~V}_{\mathrm{c}}^{3}} \tag{1}
\end{equation*}
$$

The second condition gives
$\frac{\mathrm{RT}_{\mathrm{c}}}{\left(\mathrm{V}_{\mathrm{c}}-\mathrm{nb}\right)^{3}}=\frac{3 \mathrm{na}}{\mathrm{V}_{\mathrm{c}}{ }^{4}}$
These equations give
$\mathrm{V}_{\mathrm{c}}=3 \mathrm{nb}$ and $\mathrm{T}_{\mathrm{c}}=\frac{8 \mathrm{a}}{27 \mathrm{bR}}$
For He, $\mathrm{T}_{\mathrm{c}}=5.2 \mathrm{~K}$
For $\mathrm{N}_{2}, \mathrm{~T}_{\mathrm{C}}=128 \mathrm{~K}$

Since, $T_{c}\left(N_{2}\right)$ is greater than $T_{c}(\mathrm{He}), N_{2}$ is liquefied more readily than He .
e. $\quad W=\int^{V_{2}} P d V$

$$
\begin{aligned}
& =\int_{V_{1}}^{V_{2}}\left(\frac{R T}{V-b}-\frac{a}{V^{2}}\right) d V \\
& =R T \ln \left(\frac{V_{2}-b}{V_{1}-b}\right)+a\left(\frac{1}{V_{2}}-\frac{1}{V_{1}}\right)
\end{aligned}
$$

$$
=56.7 \quad \mathrm{~L} \text { bar } \mathrm{mol}^{-1}
$$

## 3. Rates and reaction mechanisms

a. Mechanism 1:
$\frac{1}{2} \frac{\mathrm{~d}[\mathrm{HI}]}{\mathrm{dt}}=\mathrm{k}_{1}[I]^{2}\left[\mathrm{H}_{2}\right]$
Since the first step is fast, there is a pre - equilibrium :
$K=\frac{[I]^{2}}{\left[I_{2}\right]}$
$\therefore \frac{\mathrm{d}[\mathrm{HI}]}{\mathrm{dt}}=2 \mathrm{k}_{1} \mathrm{~K}\left[\mathrm{I}_{2}\right]\left[\mathrm{H}_{2}\right]=\mathrm{k}\left[\mathrm{H}_{2}\right]\left[\mathrm{I}_{2}\right]$

Mechanism 2 :

Both mechanisms are consistent with the observed rate law.
b.
i. $\quad \mathrm{k}=\mathrm{A} \mathrm{e}^{-\mathrm{E} / \mathrm{kT} T}$

$$
\mathrm{E}_{\mathrm{a}}\left(\frac{1}{\mathrm{~T}_{1}}-\frac{1}{\mathrm{~T}_{2}}\right)=\mathrm{R} \ln \frac{\mathrm{k}_{2}}{\mathrm{k}_{1}}
$$

With the given numerical values,
$E_{a}=170 \mathrm{~kJ} \mathrm{~mol}^{-1}$

$$
\begin{aligned}
& \frac{1}{2} \frac{\mathrm{~d}[\mathrm{HI}]}{\mathrm{dt}}=\mathrm{k}_{2}\left[\mathrm{I}_{2}\right]_{\mathrm{d}}\left[\mathrm{H}_{2}\right] \\
& \mathrm{K}^{\prime}=\frac{\left[\mathrm{I}_{2}\right]_{\mathrm{d}}}{\left[\mathrm{I}_{2}\right]} \\
& \therefore \quad \frac{\mathrm{d}[\mathrm{HI}]}{\mathrm{dt}}=2 \mathrm{k}_{2} \mathrm{~K}^{\prime}\left[\mathrm{I}_{2}\right]\left[\mathrm{H}_{2}\right]=\mathrm{k}\left[\mathrm{H}_{2}\right]\left[\mathrm{I}_{2}\right]
\end{aligned}
$$

ii. The activation energy is greater than the bond dissociation energy of $\mathrm{I}_{2}$. Hence the second step is rate determining in both the mechanisms.
c. The activation energy $E_{a}$ for the reverse reaction is

$$
\begin{aligned}
E_{a}^{\prime} & =E_{a}-\Delta U \\
& =170+8.2=178.2 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

d. i.

$$
\begin{aligned}
& \frac{\mathrm{d}\left[\mathrm{I}_{2}\right]}{\mathrm{dt}}=\mathrm{k}_{3}[\mathrm{IAr}][\mathrm{I}] \\
& \mathrm{K}^{\prime \prime}=\frac{[\mathrm{IAr}][\mathrm{Ar}]}{[\mathrm{I}][\mathrm{Ar}]^{2}} \\
& \begin{aligned}
\therefore \frac{\mathrm{d}\left[\mathrm{I}_{2}\right]}{\mathrm{dt}} & =\mathrm{K}^{\prime \prime} \mathrm{k}_{3}[\mathrm{I}]^{2}[\mathrm{Ar}] \\
& =\mathrm{k}[I]^{2}[\mathrm{Ar}]
\end{aligned}
\end{aligned}
$$

ii. A possible reason why this is negative is that $E a_{3}$ is positive and less in magnitude than $\left|\Delta \mathrm{H}^{\circ}\right|$, while $\Delta \mathrm{H}^{\circ}$ is negative.
$k=k_{3} K^{\prime \prime}$
$=A_{3} e^{-E_{a 3} / R T} \quad e^{-\Delta G^{\circ} / R T}$
we know $\Delta \mathrm{G}^{\circ}=\Delta \mathrm{H}^{\circ}-\mathrm{T} \Delta \mathrm{S}^{\circ}$
$\therefore \mathrm{k}=\mathrm{A}_{3} \mathrm{e}^{\frac{\Delta \mathrm{s}^{\circ}}{\mathrm{R}}} \mathrm{e}^{-\left(\mathrm{E}_{\mathrm{a} 3}+\Delta H^{\circ}\right) / R T}$
The activation energy for the overall reaction is $E_{a 3}+\Delta H^{\circ}$

## 4. Enzyme catalysis

a. i. The differential rate equations for the Michaelis-Menten mechanism are

$$
\begin{align*}
& \frac{\mathrm{d}[\mathrm{ES}]}{\mathrm{dt}}=\mathrm{k}_{1}[\mathrm{E}][\mathrm{S}]-\mathrm{k}_{1}^{\prime}[\mathrm{ES}]-\mathrm{k}_{2}[\mathrm{ES}]  \tag{1}\\
& \frac{\mathrm{d}[\mathrm{P}]}{\mathrm{dt}}=\mathrm{k}_{2}[\mathrm{ES}] \tag{2}
\end{align*}
$$

In the steady-state approximation, $\frac{\mathrm{d}[\mathrm{ES}]}{\mathrm{dt}}=0$
Eq. (1) then gives $[E S]=\frac{k_{1}[E][S]}{k_{1}^{\prime}+k_{2}}$
Now
$[E]_{0}=[E]+[E S]$
where $[E]_{0}$ is the total enzyme concentration. Eqs. (4) and (5) gives
$[E S]=\frac{[E]_{0}[S]}{\mathrm{K}_{\mathrm{m}}+[S]}$
where $K_{m}=\frac{k_{1}^{\prime}+k_{2}}{k_{1}}$ is the Michaelis-Menten constant.
From eq. (2), $\quad \frac{d[P]}{d t}=\frac{\mathrm{k}_{2}[\mathrm{E}]_{0}[\mathrm{~S}]}{\mathrm{K}_{\mathrm{m}}+[\mathrm{S}]}$

Since the backward rate is ignored, our analysis applies to the initial rate of formation of P and not close to equilibrium. Further, since the enzyme concentration is generally much smaller than the substrate concentration, [S] is nearly equal to $[S]_{0}$ in the initial stage of the reaction.

Thus, according to the Michaelis-Menten mechanism, the initial rate versus substrate concentration is described by eq. (7), where [S] is replaced by [S] ${ }_{0}$.

For $[\mathrm{S}] \ll \mathrm{K}_{\mathrm{m}}$,
Initial rate $=\frac{\mathrm{k}_{2}}{\mathrm{~K}_{\mathrm{m}}}[\mathrm{E}]_{0}[\mathrm{~S}]$
i.e., initial rate varies linearly with [S].

For [S] >> $K_{m}$,

Initial rate $=\mathrm{k}_{2}[\mathrm{E}]_{0}$
i.e., for large substrate concentration, initial rate approaches a constant value $\mathrm{k}_{2}[\mathrm{E}]_{0}$.

Thus the indicated features of the graph are consistent with Michaelis-Menten mechanism.
ii. The asymptotic value of initial rate is $k_{2}[E]_{0}$

From the graph,
$\mathrm{k}_{2}[\mathrm{E}]_{0}=3.0 \times 10^{-6} \mathrm{M} \mathrm{s}^{-1}$

With $[E]_{0}=1.5 \times 10^{-9} \mathrm{M}$
we get $\mathrm{k}_{2}=2.0 \times 10^{3} \mathrm{~s}^{-1}$
iii. From eq. (7), for $[S]=K_{m}$, the initial rate is half the asymptotic value. From the graph, therefore,

$$
K_{m}=5.0 \times 10^{-5} \mathrm{M}
$$

For $[\mathrm{S}]=1.0 \times 10^{-4} \mathrm{M}$, using eq. (7) again,

Initial rate $=\frac{\left[2.0 \times 10^{3} \mathrm{~s}^{-1}\right] \times\left[1.5 \times 10^{-9} \mathrm{M}\right] \times\left[1.0 \times 10^{-4}\right] \mathrm{M}}{\left[5.0 \times 10^{-5}\right] \mathrm{M}+\left[1.0 \times 10^{-4}\right] \mathrm{M}}$
$=2.0 \times 10^{-6} \mathrm{M} \mathrm{s}^{-1}$
iv. We have $K_{m}=\frac{k_{1}^{l}+k_{2}}{k_{1}}=5.0 \times 10^{-5} \mathrm{M}$

The enzyme equilibrates with the substrate quickly, that is the first step of equilibration between $E, S$ and [ES] is very fast. This means that $k_{1}^{\mid}$ is much greater than $\mathrm{k}_{2}$. Therefore, neglecting $\mathrm{k}_{2}$ above,
$\frac{\mathrm{k}_{1}^{\}}{\mathrm{k}_{1}}=5.0 \times 10^{-5} \mathrm{M}$
The equilibrium constant $K$ for the formation of $E S$ from $E$ and $S$ is,

$$
\frac{\mathrm{K}}{1 \mathrm{M}}=\frac{\mathrm{k}_{1}}{\mathrm{k}_{1}^{\prime}}=2.0 \times 10^{-5}
$$

b. From the graph at the new temperature, $\mathrm{k}_{2}[\mathrm{E}]_{0}=6.0 \times 10^{-6} \mathrm{M} \mathrm{s}^{-1}$

$$
\text { i.e., } \quad k_{2}=\frac{6.0 \times 10^{-6} \mathrm{M} \mathrm{~s}^{-1}}{1.5 \times 10^{-9} \mathrm{M}}=4.0 \times 10^{3} \mathrm{~s}^{-1}
$$

Using Arrhenius relation for temperature dependence of rate constant :
$k=A e^{-\frac{E_{a}}{R T}}$
where $\mathrm{E}_{\mathrm{a}}$ is the molar activation energy.
$\frac{k\left(T_{1}\right)}{k\left(T_{2}\right)}=e^{-\frac{E_{2}}{R}\left[\frac{1}{T_{1}}-\frac{1}{T_{2}}\right]}$
i.e. $\quad E_{a}=R \frac{\ln \frac{k\left(T_{2}\right)}{k\left(T_{1}\right)}}{\left(\frac{1}{T_{1}}-\frac{1}{T_{2}}\right)}$

Now $\frac{\mathrm{k}_{2}(310)}{\mathrm{k}_{1}(285)}=2.0, \quad \mathrm{R}=8.31 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}$
$\therefore \quad \mathrm{E}_{\mathrm{a}}=20.4 \mathrm{~kJ} \mathrm{~mol}^{-1}$
c. i. The fraction of the enzyme that binds with the substrate is, from eq.
(6):
$\frac{[\mathrm{ES}]}{[\mathrm{E}]_{0}}=\frac{[\mathrm{S}]}{\mathrm{K}_{\mathrm{m}}+[\mathrm{S}]}$
where $[S]$ is nearly equal to $[S]_{0}$ in the initial stage of the reaction.
Now $[S]_{0}=\frac{3.0 \times 10^{-6} \mathrm{~mol}}{1 \times 10^{-3} \mathrm{~L}}=3.0 \times 10^{-3} \mathrm{M}$
and $K_{m}=5.0 \times 10^{-5} \mathrm{M}$

$$
\therefore \frac{[\mathrm{ES}]}{[\mathrm{E}]_{0}}=\frac{3.0 \times 10^{-3} \mathrm{M}}{\left(5.0 \times 10^{-5}+3.0 \times 10^{-3}\right) \mathrm{M}}=0.98
$$

Nearly the whole of the enzyme is bound with the substrate.
ii. From eq. (7),

Integrating the equation gives,
$\frac{\mathrm{d}[\mathrm{S}]}{\mathrm{dt}}=-\frac{\mathrm{k}_{2}[\mathrm{E}]_{0}[\mathrm{~S}]}{\mathrm{K}_{\mathrm{m}}+[\mathrm{S}]}$

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{m}} \ln \frac{[\mathrm{~S}]}{[\mathrm{S}]_{0}}+[\mathrm{S}]-[\mathrm{S}]_{0}=-\mathrm{k}_{2}[\mathrm{E}]_{0} \mathrm{t} \\
& \text { If at } \mathrm{t}=\mathrm{T},[\mathrm{~S}]=1 / 2[\mathrm{~S}]_{0}, \\
& \mathrm{~T} \mathrm{k}_{2}[\mathrm{E}]_{0}=\mathrm{K}_{\mathrm{m}} \ln 2+\frac{1}{2}[\mathrm{~S}]_{0} \\
& \text { Here }[\mathrm{E}]_{0}=\frac{2.0 \times 10^{-12} \mathrm{~mol}}{1.0 \times 10^{-3} \mathrm{~L}}=2.0 \times 10^{-9} \mathrm{M} \\
& \mathrm{k}_{2}=2.0 \times 10^{3} \mathrm{~s}^{-1}, \quad \mathrm{~K}_{\mathrm{m}}=5.0 \times 10^{-5} \mathrm{M} \\
& {[\mathrm{~S}]_{0}=3.0 \times 10^{-3} \mathrm{M}}
\end{aligned}
$$

Substituting these values in eq. (14) gives
$\mathrm{T}=384 \mathrm{~s}$

Thus $50 \%$ of the antibiotic dose is inactivated in 384 s .
d. i. The differential rate equations for the situation are :

$$
\begin{align*}
\frac{d}{d t}[E S] & =k_{1}[E][S]-k_{1}^{\prime}[E S]-k_{2}[E S]  \tag{15}\\
\frac{d}{d t}[E I] & =k_{3}[E][I]-k_{3}^{\prime}[E I]  \tag{16}\\
\frac{d}{d t}[P] & =k_{2}[E S] \tag{17}
\end{align*}
$$

where $k_{3}$ and $k_{3}^{\prime}$ are the forward and backward rate constants for the enzyme-inhibitor reaction.

Applying steady-state approximation to [ES] and [EI],

$$
\begin{equation*}
[E S]=\frac{k_{1}[E][S]}{k_{1}^{l}+k_{2}} \tag{18}
\end{equation*}
$$

and $[E I]=\frac{\mathrm{k}_{3}[E][I]}{\mathrm{k}_{3}^{〕}}$
Now $[E]_{0}=[E]+[E S]+[E I]$

Eliminating [E] and [EI] from eqs. (18) to (20) gives :
$[\mathrm{ES}]=\frac{[\mathrm{E}]_{0}[\mathrm{~S}]}{[\mathrm{S}]+\mathrm{K}_{\mathrm{m}}\left(1+\frac{[\mathrm{I}]}{\mathrm{K}_{\mathrm{I}}(1 \mathrm{M})}\right)}$
$\frac{\mathrm{d}[\mathrm{P}]}{\mathrm{dt}}=\frac{\mathrm{k}_{2}[\mathrm{E}]_{0}[\mathrm{~S}]}{[\mathrm{S}]+\mathrm{K}_{\mathrm{m}}\left(1+\frac{[\mathrm{I}]}{\mathrm{K}_{1}(1 \mathrm{M})}\right)}$
Here, $\mathrm{K}_{\mathrm{l}}(1 \mathrm{M})=\frac{\mathrm{k}_{3}^{\prime}}{\mathrm{k}_{3}}$ is the equilibrium constant for the dissociation of El to E and I.

The degree of inhibition is $i=1-\frac{r}{r_{0}}$
Using eq. (22), $\mathrm{i}=\frac{\frac{\mathrm{K}_{\mathrm{m}}}{\mathrm{K}_{\mathrm{t}}} \frac{[I]}{(1 \mathrm{M})}}{[\mathrm{S}]+\mathrm{K}_{\mathrm{m}}\left(1+\frac{[I]}{\mathrm{K}_{\mathrm{I}}(1 \mathrm{M})}\right)}$

For fixed [l], i decreases with increase in [S] (competitive inhibition).
and for large $[\mathrm{S}], \quad \mathrm{i} \rightarrow 0$, i.e., the inhibitor ceases to play any role.
ii. For small $[\mathrm{S}] \quad \mathrm{i}=\frac{[I]}{\mathrm{K}_{1}(1 \mathrm{M})+[I]}$

If $r=\frac{1}{4} r_{0}, \quad i=\frac{3}{4}$
i.e., $[1]=3 \mathrm{~K}_{1} \times(1 \mathrm{M})=1.5 \times 10^{-4} \mathrm{M}$

The inhibitor concentration required to reduce the rate of inactivation by a factor of 4 is $1.5 \times 10^{-4} \mathrm{M}$; i.e., $0.15 \mu \mathrm{~mol}$ in a volume of 1.00 mL .

## 5. Schrödinger equation

a.
i. One-dimensional Schrödinger equation for a free particle of mass m:

$$
-\frac{\hbar^{2}}{2 m} \frac{\mathrm{~d}^{2} \psi}{\mathrm{dx}^{2}}=\mathrm{E} \psi \quad \hbar=\frac{\mathrm{h}}{2 \pi}
$$

where E stands for the energy of the particle and $\psi$ its wave function.
ii. The boundary conditions are :
$\psi(0)=\psi(\mathrm{L})=0$
Only $\quad \Psi_{n}(x)=\sin \frac{n \pi x}{L}$ satisfies the required boundary conditions.

Other functions are not possible wave functions of the electron in a one-dimensional rigid box.
iii.

$$
\begin{aligned}
& -\frac{\hbar^{2}}{2 m} \frac{d^{2}}{d x^{2}} \sin \frac{n \pi x}{L}=\frac{\hbar^{2} \pi^{2}}{2 m L^{2}} n^{2} \sin \frac{n \pi x}{L} \\
& \therefore \quad E_{n}=\frac{\hbar^{2} \pi^{2}}{2 m L^{2}} n^{2}=\frac{h^{2} n^{2}}{8 m L^{2}}
\end{aligned}
$$

iv. Ground state $(\mathrm{n}=1)$

$$
\Psi_{1}(x)=\sin \frac{\pi x}{L}
$$

First excited state $(\mathrm{n}=2)$
$\Psi_{2}(x)=\sin \frac{2 \pi x}{L}$
Second excited state $(\mathrm{n}=3)$
$\Psi_{3}(x)=\sin \frac{3 \pi x}{L}$

Number of nodes in $\Psi_{\mathrm{n}}=\mathrm{n}-1$, apart from the nodes at the end points.
v.

$$
\begin{aligned}
\Psi_{1}^{N}(x) & =N \sin \frac{\pi x}{L} \\
1 & =\int_{-\infty}^{\infty}\left|\Psi_{1}^{N}(x)\right| d x \\
& =N^{2} \int_{0}^{L} \sin ^{2} \frac{\pi x}{L} d x=\frac{N^{2}}{2} \int_{0}^{L}\left(1-\cos \frac{2 \pi x}{L}\right) d x \\
& =N^{2} \frac{L}{2} \\
\therefore N & =\sqrt{\frac{2}{L}} \quad(N \text { is chosen to be real }) \\
\Psi_{1}^{N}(x) & =\sqrt{\frac{2}{L}} \sin \frac{\pi x}{L}
\end{aligned}
$$

b. In the example
$\mathrm{L}=5 \times 1.4 \times 10^{-10} \mathrm{~m}=7.0 \times 10^{-10} \mathrm{~m}$
The first three energy levels are:
$E_{1}=\frac{h^{2}}{8 \mathrm{~mL}^{2}}=1.22 \times 10^{-19} \mathrm{~J}$
$E_{2}=4 E_{1}=4.88 \times 10^{-19} \mathrm{~J}$
$E_{3}=9 E_{1}=10.98 \times 10^{-19} \mathrm{~J}$
In the ground state, the four electrons will occupy the levels $E_{1}$ and $E_{2}$, each with two electrons.

The lowest excitation energy
$E_{3}-E_{2}=6.10 \times 10^{-19} \mathrm{~J}$
C. The condition that $\psi(\phi)$ is single valued demands that
$\Psi(\phi)=\Psi(\phi+2 \pi)$
$e^{i \lambda \phi}=e^{i \lambda(\phi+2 \pi)}$
$e^{i 2 \pi \lambda}=1$
i.e. $\lambda=m$, where $m=0, \pm 1, \pm 2, \pm 3, \ldots \ldots$.

This shows that angular momentum projection $\left(L_{z}\right)$ cannot be an arbitrary real number but can have only discrete values: $\mathrm{m} \hbar$, where m is a positive or negative integer (including zero).

## 6. Atomic and molecular orbitals

A. Atomic orbitals
a.

$$
\begin{aligned}
& \Psi_{1 s}^{N}=N e^{-\frac{r}{a_{0}}} \\
& 1=\int\left|\Psi_{1 s}^{N}\right|^{2} d v=4 \pi a_{o}^{3} N^{2} \\
&=4 \pi N^{2} \times \frac{a_{0}^{3}}{4}=\pi a_{o}^{3} N^{2} \\
& \therefore \quad N=\left[\pi a_{o}^{3}\right]^{-\frac{1}{2}} \\
& \Psi_{1 s}^{N}=\left[\pi a_{o}^{3}\right]^{-\frac{1}{2}} e^{-\frac{r}{a_{0}}}
\end{aligned}
$$

( N chosen to be real)
ii. Probability of finding an electron between $r$ and $r+d r$

$$
=4 \pi r^{2} \times\left[\pi a_{0}^{3}\right]^{-1} e^{-\frac{2 r}{a_{0}}} d r
$$

This is a maximum at $r=r_{\text {max }}$, given by

$$
\left.\frac{d}{d r}\left(r^{2} e^{-\frac{2 r}{a_{0}}}\right)\right|_{r=r_{\max }}=0
$$

This gives

$$
r_{\max }=a_{0}
$$

The 1 s electron is most likely to be found in the neighborhood of $r=a_{0}$.
b. $\quad \Psi_{2 s}=0 \quad$ at $r=2 a 0$

Nodal surface is a sphere of radius $2 \mathrm{a}_{0}$

$$
\Psi_{2 p_{z}}=0 \quad \text { at } \theta=\frac{\pi}{2}
$$

Nodal surface is the xy plane.
$\Psi_{3 d_{z^{2}}}=0 \quad$ at $3 \cos ^{2} \theta-1=0, \quad$ i.e., $\theta=\cos ^{-1}\left( \pm \frac{1}{\sqrt{3}}\right)$
Nodal surfaces are cones with these values of half-angle, one above the xy plane and the other below it.
(Note: all three wave functions vanish as $r \rightarrow \infty$. At $r=0, \psi_{\text {is }}$ does not vanish, but the other two wave functions vanish.)
c. Each electron in $n=1$ shell of helium atom has energy $-Z^{2}$ eff $\times 13.6 \mathrm{eV}$

Helium ground state energy $=-Z^{2}$ eff $\times 27.2 \mathrm{eV}$
Energy of $\mathrm{He}^{+}$ground state $=-4 \times 13.6=-54.4 \mathrm{eV}$
Ionization energy $=\left(-54.4+Z^{2}\right.$ eff $\left.\times 27.2\right) \mathrm{eV}=24.46 \mathrm{eV}$
This gives $Z_{\text {eff }}=1.70$

## B. Molecular orbitals

a. $\quad \Psi_{1}$ and $\Psi_{2}$ are bonding orbitals
$\tilde{\Psi}_{1}$ and $\tilde{\Psi}_{2}$ are antibonding orbitals

## Bonding orbital

No nodal surface between the nuclei. Electronic energy has a minimum at a certain internuclear distance. Qualitative reason: electron has considerable probability of being between the nuclei and thus has attractive potential energy due to both the nuclei.

## Antibonding orbital

Nodal surface between the nuclei. Electronic energy decreases monotonically with internuclear distance. Hence bound state is not possible.
b. $\quad R_{e}=1.32 \times 10^{-10} \mathrm{~m}$
$\mathrm{D}=-1.36-(-15.36)=1.76 \mathrm{eV}$
c. It will dissociate to a hydrogen atom in 2s state and a bare hydrogen nucleus (proton).
d. The two electrons occupy the same molecular orbital with the lowest energy. By Pauli's principle, their spins must be antiparallel. Hence the total electronic spin is zero.
e. In the first excited state of $\mathrm{H}_{2}$, one electron is in $\psi_{1}$ (bonding orbital) and the other in $\psi_{1}$ (antibonding orbital). It will dissociate into two hydrogen atoms.
f. Using the aufbau principle, in the ground state two electrons of $\mathrm{He}_{2}$ are in $\psi_{1}$ (bonding orbital) and two in $\psi_{1}$ (antibonding orbital). The bond order is $1 / 2(2-2)=0$

Therefore, bound $\mathrm{He}_{2}$ is unstable and difficult to detect. However, if one or more electrons are elevated from the antibonding orbital to (higher energy) bonding orbitals, the bond order becomes greater than zero. This is why it is possible to observe $\mathrm{He}_{2}$ in excited states.

## 7. Fission

a.

$$
\begin{aligned}
& { }_{92}^{235} \mathrm{U}+\mathrm{n} \rightarrow{ }_{38}^{94} \mathrm{Sr}+{ }_{54}^{140} \mathrm{Xe}+2 \mathrm{n} \\
& { }_{92}^{235} \mathrm{U}+\mathrm{n} \rightarrow{ }_{56}^{141} \mathrm{Ba}+{ }_{36}^{92} \mathrm{Kr}+3 \mathrm{n}
\end{aligned}
$$

b. The net nuclear reaction is

$$
{ }_{92}^{235} \mathrm{U}+\mathrm{n} \rightarrow{ }_{40}^{94} \mathrm{Zr}+{ }_{58}^{140} \mathrm{Ce}+2 \mathrm{n}+6 \mathrm{e}^{-}+(\mathrm{Q})
$$

The energy released is
$Q=\left[m_{N}\left({ }^{235} U\right)-m_{N}\left({ }^{94} Z r\right)-m_{N}\left({ }^{140} C e\right)-m_{n}-6 m_{e}\right] c^{2}$
where the small energy of the initial thermal neutron has been ignored. $\left(\mathrm{m}_{\mathrm{N}}\right.$ denotes the nuclear mass.) Now
$\mathrm{m}_{\mathrm{N}}\left({ }^{235} \mathrm{U}\right)=\mathrm{m}\left({ }^{235} \mathrm{U}\right)-92 \mathrm{~m}_{\mathrm{e}}$
ignoring the small electronic binding energies compared to rest mass energies.
Similarly for other nuclear masses.
$Q=\left[m\left({ }^{235} \mathrm{U}\right)-\mathrm{m}\left({ }^{94} \mathrm{Zr}\right)-\mathrm{m}\left({ }^{140} \mathrm{Ce}\right)-\mathrm{m}_{\mathrm{n}}\right] \mathrm{c}^{2}$
Using the given data,
$Q=213.3 \mathrm{MeV}$
c. $\quad 1 \mathrm{MWd}=10^{6} \mathrm{Js}^{-1} \times 24 \times 3600 \mathrm{~s}=8.64 \times 10^{10} \mathrm{~J}$

No. of atoms of ${ }^{235} \mathrm{U}$ fissioned $=\frac{8.64 \times 10^{10}}{213.3 \times 1.60 \times 10^{-13}}=2.53 \times 10^{21}$
Mass of ${ }^{235} \mathrm{U}$ fissioned $=\frac{2.53 \times 10^{21} \times 235}{6.02 \times 10^{23}}=0.99 \mathrm{~g}$

Mass of ${ }^{235} \mathrm{U}$ in 1 kg uranium removed from the reactor $=7.2-0.99=6.2 \mathrm{~g}$

Abundance of ${ }^{235} \mathrm{U}$ is $0.62 \%$

## 8. Radioactive decay

a. $\quad 1 \mu \mathrm{Ci}=3.7 \times 10^{4}$ disintegrations per second $(\mathrm{dps})$.

Initial $\beta$-activity $=3.7 \times 10^{6} \mathrm{dps}$
$\left.\frac{-\mathrm{dN}_{1}}{\mathrm{dt}}\right|_{\mathrm{t}=0}=\mathrm{N}_{1}^{0} \lambda_{1}=3.7 \times 10^{6} \mathrm{dps}$
where $N_{1}^{0}$ is the number of atoms of ${ }^{210} \mathrm{Bi}$ at $\mathrm{t}=0$ and $\lambda_{1}$ is its decay constant.

$$
\begin{aligned}
& \frac{0.693}{5.01 \times 24 \times 3600} \mathrm{~N}_{1}^{0}=3.7 \times 10^{6} \\
& \mathrm{~N}_{1}^{0}=2.31 \times 10^{12}
\end{aligned}
$$

Intial mass of ${ }^{210} \mathrm{Bi}=2.31 \times 10^{12} \times \frac{210}{6.02 \times 10^{23}} \mathrm{~g}$
$=8.06 \times 10^{-10} \mathrm{~g}$
b. Number of atoms of ${ }^{210} \mathrm{Bi}$ at time t is given by

$$
N_{1}=N_{1}^{0} e^{-\lambda_{1} t}
$$

The number of atoms of ${ }^{210} \mathrm{Po}, N_{2}$, is given by equation
$\frac{\mathrm{d} \mathrm{N}_{2}}{\mathrm{dt}}=\lambda_{1} \mathrm{~N}_{1}-\lambda_{2} \mathrm{~N}_{2}$
where $\lambda_{2}$ is the decay constant of ${ }^{210} \mathrm{Po}$.
$\frac{d N_{2}}{d t}=\lambda_{1} N_{1}^{0} e^{-\lambda_{1} t}-\lambda_{2} N_{2}$
Using the integrating factor $\mathrm{e}^{\lambda 2 t}$
$e^{\lambda_{2} t} \frac{d N_{2}}{d t}+\lambda_{2} N_{2} e^{\lambda_{2} t}=\lambda_{1} N_{1}^{0} e^{\left(\lambda_{2}-\lambda_{1}\right) t}$
$\frac{d}{d t}\left(N_{2} e^{\lambda_{2} t}\right)=\lambda_{1} N_{1}^{0} e^{\left(\lambda_{2}-\lambda_{1}\right) t}$

Integrating
$N_{2} e^{\lambda_{2} t}=\frac{\lambda_{1}}{\lambda_{2}-\lambda_{1}} N_{1}^{0} e^{\left(\lambda_{2}-\lambda_{1}\right) t}+C$
To calculate C , use the condition that at $\mathrm{t}=0, \mathrm{~N}_{2}=0$
$C=-\frac{\lambda_{1} N_{1}^{0}}{\lambda_{2}-\lambda_{1}}$
This gives
$N_{2}=\frac{\lambda_{1}}{\lambda_{2}-\lambda_{1}} N_{1}^{0}\left(e^{-\lambda_{1} t}-e^{-\lambda_{2} t}\right)$

The time $t=T$ when $N_{2}$ is maximum is given by the condition
$\left.\frac{d N_{2}}{d t}\right|_{t=T}=0$
which gives
$\mathrm{T}=\frac{\ln \frac{\lambda_{1}}{\lambda_{2}}}{\lambda_{1}-\lambda_{2}}=24.9 \mathrm{~d}$
At $t=T, N_{2}$ can be calculated from above.
$N_{2}=2.04 \times 10^{12}$

Mass of ${ }^{210} \mathrm{Po}$ at $\mathrm{t}=\mathrm{T}$,
$=7.11 \times 10^{-10} \mathrm{~g}$
c. $\quad \alpha$-disintegration rate of ${ }^{210} \mathrm{Po}$ at $\mathrm{t}=\mathrm{T}$
$=1.18 \times 10^{5} \mathrm{dps}$

At $\mathrm{t}=\mathrm{T}$
$\beta$-disintegration rate of ${ }^{210} \mathrm{Bi}$
$=\alpha$-disintegration rate of ${ }^{210} \mathrm{Po}=1.18 \times 10^{5} \mathrm{dps}$
9. Redox reactions
a.
i. Over-all reaction

$$
\begin{aligned}
\mathrm{Sn}^{2+}+2 \mathrm{Fe}^{3+} \rightarrow & \mathrm{Sn}^{4+}+2 \mathrm{Fe}^{2+} \quad \mathrm{E}^{\circ}=+0.617 \mathrm{~V} \\
\Delta \mathrm{G}^{\circ}=-\mathrm{nFE} & \\
& =-2 \mathrm{FE}^{\circ} \\
& =-2 \times 96485 \times 0.617 \mathrm{~V} \\
& =-119 \mathrm{KJ}
\end{aligned}
$$

$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
ii.

$$
\begin{aligned}
E^{\circ}= & \frac{0.0592}{n} \log K \\
\log K & =\frac{(2 \times 0.617)}{0.0592} \cong 20.84 \\
K & =6.92 \times 10
\end{aligned}
$$

b. Before the equivalence point, $E$ of the cell is given by following equation

$$
\begin{aligned}
\mathrm{E}_{\text {cell }} & ={ }_{\mathrm{ox}} \mathrm{E}_{\text {S.C.E }}^{0}+{ }_{\text {red }} \mathrm{E}_{\mathrm{Sn}^{4+} / \mathrm{Sn}^{2+}}^{\circ}-\frac{0.0592}{2} \log \frac{\left[\mathrm{Sn}^{2+}\right]}{\left[\mathrm{Sn}^{4+}\right]} \\
& =-0.242+0.154-\frac{0.0592}{2} \log \frac{\left[\mathrm{Sn}^{2+}\right]}{\left[\mathrm{Sn}^{4+}\right]}
\end{aligned}
$$

i. The addition of 5.00 mL of $\mathrm{Fe}^{3+}$ converts $5.00 / 20.00$ of the $\mathrm{Sn}^{2+}$ to $\mathrm{Sn}^{4+}$; thus
$\frac{\left[\mathrm{Sn}^{2+}\right]}{\left[\mathrm{Sn}^{4+}\right]}=\frac{15.0 / 20.0}{5.0 / 20.0}=3.00$
$\mathrm{E}_{\text {cell }}=-0.102 \mathrm{~V}$.
ii. At the equivalence point, add the two expressions corresponding to $\mathrm{Sn}^{4+} / \mathrm{Sn}^{2+}$ and $\mathrm{Fe}^{3+} / \mathrm{Fe}^{2+}$.
$2 \mathrm{E}_{\text {cell }}=2{ }_{\text {ox }} \mathrm{E}_{\text {S.C.E }}^{\circ}+2 \mathrm{red}_{\mathrm{Sn}^{4+} / \mathrm{Sn}^{2+}}^{\circ}-0.0592 \log \frac{\left[\mathrm{Sn}^{2+}\right]}{\left[\mathrm{Sn}^{4+}\right]}$
$1 \mathrm{E}_{\text {cell }}={ }_{\text {ox }} \mathrm{E}_{\text {S.C.E }}^{\circ}+\mathrm{red}_{\mathrm{Fe}^{3+} / \mathrm{Fe}^{2+}}^{\circ}-0.0592 \log \frac{\left[\mathrm{Fe}^{2+}\right]}{\left[\mathrm{Fe}^{3+}\right]}$
to get
$3 \mathrm{E}_{\text {cell }}=3{ }_{\text {ox }} \mathrm{E}_{\text {S.C.E }}^{\circ}+2{ }_{\mathrm{red}} \mathrm{E}_{\mathrm{Sn}^{4+} / \mathrm{Sn}^{2+}}^{\circ}+{ }_{\mathrm{red}} \mathrm{E}_{\mathrm{Fe}^{3+/ F e e^{2+}}}^{\circ}-0.0592 \log \frac{\left[\mathrm{Sn}^{2+}\right]\left[\mathrm{Fe}^{2+}\right]}{\left[\mathrm{Sn}^{4+}\right]\left[\mathrm{Fe}^{3+}\right]}$

At the equivalence point, $\left[\mathrm{Fe}^{3+}\right]=2\left[\mathrm{Sn}^{2+}\right]$ and $\left[\mathrm{Fe}^{2+}\right]=2\left[\mathrm{Sn}^{4+}\right]$
Thus,

$$
\begin{aligned}
& E_{\text {cell }}={ }_{\text {ox }} E_{\text {S.C.E }}^{\circ}+\frac{2{ }_{\mathrm{red}} \mathrm{E}_{\mathrm{Sn}^{4+} / \mathrm{Sn}^{2+}}^{\circ}+{ }_{\mathrm{red}} \mathrm{E}_{\mathrm{Fe}^{2+} / \mathrm{Fe}^{3+}}^{\circ}}{3} \\
& =-0.242+\frac{(2)(0.154)+0.771}{3}=+0.118 \mathrm{~V}
\end{aligned}
$$

Beyond the equivalence point, E of the cell is given by following equation
$E_{\text {cell }}={ }_{0 x} E_{\text {S.C.E }}^{\circ}+{ }_{\mathrm{red}} \mathrm{E}_{\mathrm{Fe}^{3+/ / \mathrm{Fe}^{2+}}}^{\circ}-0.0592 \log \frac{\left[\mathrm{Fe}^{2+}\right]}{\left[\mathrm{Fe}^{3+}\right]}$

When 30 mL of $\mathrm{Fe}^{3+}$ is added , 10 mL of $\mathrm{Fe}^{3+}$ is in excess. i.e.
$\frac{\left[\mathrm{Fe}^{2+}\right]}{\left[\mathrm{Fe}^{3+}\right]}=\frac{20.0}{10.0}=2.00$
$\mathrm{E}_{\text {cell }}=0.511 \mathrm{~V}$
c.
i. $\quad \Delta G^{\circ}=-R T \ln K_{\text {sp }}$

$$
=68.27 \mathrm{~K} \mathrm{~J}
$$

$$
\Delta G^{\circ}=-n F E^{\circ}, \quad n=1
$$

$$
E^{\circ}=-0.707 \mathrm{~V}
$$

ii. $\quad \mathrm{Cu}^{+}+\mathrm{I}^{-} \rightleftharpoons \mathrm{Cul}_{(\mathrm{s})}$ $E^{\circ}=0.707 \mathrm{~V}$
$\mathrm{Cu}^{2+}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Cu}^{+}$ $\mathrm{E}^{\circ}=0.153 \mathrm{~V}$

The overall reaction for reduction of $\mathrm{Cu}^{2+}$ by $\mathrm{I}^{-}$is
$\mathrm{Cu}^{2+}+\mathrm{I}^{-}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Cul}_{(\mathrm{s})}$
$E^{\circ}=0.86 \mathrm{~V}$

The $\mathrm{E}^{\circ}$ value for the reduction of $\mathrm{Cu}^{2+}$ by $\mathrm{I}^{-}$can now be calculated
$2 \times \mathrm{Cu}^{2+}+\mathrm{I}^{-}+\mathrm{e}^{-} \rightleftharpoons \mathrm{Cul}_{(\mathrm{s})}$
$E^{\circ}=0.86 \mathrm{~V}$
$\mathrm{I}_{2}+2 \mathrm{e}^{-} \rightleftharpoons 2 \mathrm{I}^{-}$
$\mathrm{E}^{\circ}=0.535 \mathrm{~V}$

The over-all reaction is

$$
2 \mathrm{Cu}^{2+}+4 \mathrm{I}^{-} \rightarrow 2 \mathrm{CuI}_{(\mathrm{s})}+\mathrm{I}_{2} \quad \mathrm{E}^{\circ}=0.325 \mathrm{~V}
$$

The positive value of effective $\mathrm{E}^{\circ}$ indicates that the reduction reaction is spontaneous. This has come about since in this reaction, $\mathrm{I}^{-}$is not only a reducing agent, but is also a precipitating agent. Precipitation of $\mathrm{Cu}^{+}$ as Cul is the key step of the reaction, as it practically removes the product $\mathrm{Cu}^{+}$from the solution, driving the reaction in the forward direction.
iii. $\quad \Delta \mathrm{G}^{0}=-n F E^{0}$

$$
\begin{aligned}
& \text { Here } \quad n=1, \quad E^{\circ}=0.325 V \\
& \Delta G^{\circ}=-31.3 \mathrm{~kJ} \\
& \Delta G^{\circ}=- \\
& \log K=5.47 \\
& K=2.9 \times 10^{5}
\end{aligned}
$$

## 10. Solubility of sparingly soluble salts

a. $\quad \mathrm{Ag}_{2} \mathrm{C}_{2} \mathrm{O}_{4(\mathrm{~s})} \rightleftharpoons 2 \mathrm{Ag}^{+}+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$

The solubility product Ksp is given by
$\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}\right]$

If S is the solubility of $\mathrm{Ag}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$
$\left[\mathrm{Ag}^{+}\right]=2 \mathrm{~S}$
The total oxalate concentration, denoted by $\mathrm{C}_{0 \mathrm{x}}$, is
$\mathrm{C}_{0 \mathrm{x}}=\mathrm{S}=\left[\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}\right]+\left[\mathrm{HC}_{2} \mathrm{O}_{4}{ }^{-}\right]+\left[\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}\right]$
The dissociation reactions are:

$$
\begin{array}{ll}
\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \rightleftharpoons \mathrm{H}^{+}+\mathrm{HC}_{2} \mathrm{O}_{4}^{-} & \mathrm{K}_{1}=5.6 \times 10^{-2} \\
\mathrm{HC}_{2} \mathrm{O}_{4}^{-} \rightleftharpoons \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-} & \mathrm{K}_{2}=6.2 \times 10^{-5} \tag{4}
\end{array}
$$

Eqs. (2), (3) and (4) give
$C_{o x}=S=\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2}\right]+\frac{\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2}\right]\left[\mathrm{H}^{+}\right]}{\mathrm{K}_{2}}+\frac{\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]\left[\mathrm{H}^{+}\right]^{2}}{\mathrm{~K}_{1} \mathrm{~K}_{2}}$
$\therefore \quad\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]=\alpha \mathrm{C}_{0 \mathrm{ox}}=\alpha \mathrm{S}$
where $\quad \alpha=\frac{\mathrm{K}_{1} \mathrm{~K}_{2}}{\left[\mathrm{H}^{+}\right]^{2}+\mathrm{K}_{1}\left[\mathrm{H}^{+}\right]+\mathrm{K}_{1} \mathrm{~K}_{2}}$
At $\mathrm{pH}=7,\left[\mathrm{H}^{+}\right]=10^{-7}$ and $\alpha \cong 1$
$\mathrm{K}_{\mathrm{sp}}=4 \mathrm{~S}^{3}=3.5 \times 10^{-11}$

At $\mathrm{pH}=5.0,\left[\mathrm{H}^{+}\right]=10^{-5}$

From the values of $\mathrm{K}_{1}, \mathrm{~K}_{2}$ and $\left[\mathrm{H}^{+}\right]$, we get
$\alpha=0.861$
$\mathrm{K}_{\mathrm{sp}}=[2 \mathrm{~S}]^{2}[\alpha \mathrm{~S}]$
$\therefore \quad S=\left(\frac{\mathrm{K}_{\mathrm{sp}}}{4 \alpha}\right)^{\frac{1}{3}}=2.17 \times 10^{-4}$
b. $\quad\left[\mathrm{NH}_{3}\right]=0.002$

At $\mathrm{pH}=10.8, \quad\left[\mathrm{H}^{+}\right]=1.585 \times 10^{-11}$

Eq. (5) implies
$\alpha=1$
i.e $\quad \mathrm{C}_{0 x}=\mathrm{S}=\left[\mathrm{C}_{2} \mathrm{O}_{4}{ }^{-2}\right]$

The total silver ion in the solution is given by
$\mathrm{C}_{\mathrm{Ag}}=2 \mathrm{~S}=\left[\mathrm{Ag}^{+}\right]+\left[\mathrm{AgNH}_{3}{ }^{+}\right]+\left[\mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}{ }^{+}\right]$
$33^{\text {rd }}$ International Chemistry Olympiad * Preparatory Problems
The complex formation reactions are
$\mathrm{Ag}^{+}+\mathrm{NH}_{3} \rightleftharpoons \mathrm{AgNH}_{3}{ }^{+}$

$$
\begin{equation*}
\mathrm{K}_{3}=1.59 \times 10^{3} \tag{9}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{AgNH}_{3}^{+}+\mathrm{NH}_{3} \rightleftharpoons \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}^{+} \quad \mathrm{K}_{4}=6.76 \times 10^{3} \tag{10}
\end{equation*}
$$

From eqs. (8), (9) and (10)

$$
\begin{aligned}
& \mathrm{C}_{\mathrm{Ag}}=2 \mathrm{~S}=\left[\mathrm{Ag}^{+}\right]\left\{1+\mathrm{K}_{3}\left[\mathrm{NH}_{3}\right]+\mathrm{K}_{3} \mathrm{~K}_{4}\left[\mathrm{NH}_{3}\right]^{2}\right\} \\
& \therefore \quad\left[\mathrm{Ag}^{+}\right]=\beta \times \mathrm{C}_{\mathrm{Ag}}=\beta \times 2 \mathrm{~S} \\
& \text { where } \quad \beta=\frac{1}{1+\mathrm{K}_{3}\left[\mathrm{NH}_{3}\right]+\mathrm{K}_{3} \mathrm{~K}_{4}\left[\mathrm{NH}_{3}\right]^{2}}
\end{aligned}
$$

Using the values of $\mathrm{K} 3, \mathrm{~K}_{4}$ and $\left[\mathrm{NH}_{3}\right]$,
$\beta=2.31 \times 10^{-4}$
$\mathrm{K}_{\mathrm{sp}}=\left[\mathrm{Ag}^{+}\right]^{2}\left[\mathrm{C}_{2} \mathrm{O}_{4}^{2-}\right]$
$=[\beta \times 2 S]^{2}[S]$
$\therefore S=\left(\frac{\mathrm{K}_{\mathrm{sp}}}{4 \beta^{2}}\right)^{\frac{1}{3}}$
$=5.47 \times 10^{-2}$

## 11. Spectrophotometry

a. Denote the molar absorptivity of $\mathrm{MnO}_{4}^{-}$at 440 nm and 545 nm by $\varepsilon_{1}$ and $\varepsilon_{2}$ and that of $\mathrm{Cr}_{2} \mathrm{O}_{7}^{-}$by $\epsilon_{3}$ and $\epsilon_{4}$ :
$\epsilon_{1}=95 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}, \quad \epsilon_{2}=2350 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}$
$\epsilon_{3}=370 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}, \quad \epsilon_{4}=11 \mathrm{Lmol}^{-1} \mathrm{~cm}^{-1}$
The absorbance A is related to \% transmittance T by
$A=2-\log T$
From the values given for the sample solution
$\mathrm{A}_{440}=2-\log 35.5=0.45$
$A_{545}=2-\log 16.6=0.78$

Now if one denotes the molar concentrations of $\mathrm{MnO}_{4}{ }^{-}$and $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}$ in the steel sample solution by $\mathrm{C}_{1}$ and $\mathrm{C}_{2}$ respectively, we have
$A_{440}=\epsilon_{1} \times C_{1} \times 1+\epsilon_{3} \times C_{2} \times 1$
$A_{545}=\epsilon_{2} \times C_{1} \times 1+\epsilon_{4} \times C_{2} \times 1$

Using the given data, we get
$\mathrm{C}_{1}=0.0003266 \mathrm{M}$
$\mathrm{C}_{2}=0.001132 \mathrm{M}$

Amount of Mn in 100 mL solution
$=0.0003266 \mathrm{molL}^{-1} \times 54.94 \mathrm{gmol}^{-1} \times 0.1 \mathrm{~L}^{2}$
$=0.001794 \mathrm{~g}$
$\%$ Mn in steel sample $=\frac{0.001794 \times 100}{1.374}=0.13 \%$

Amount of Cr present in 100 mL solution
$=0.001132 \mathrm{~mol} \mathrm{~L}^{-1} \times 2 \times 52.00 \mathrm{~g} \mathrm{~mol}^{-1} \times 0.1 \mathrm{~L}$
$=0.0118 \mathrm{~g}$
$\%$ Cr in steel sample $=\frac{0.0118 \times 100}{1.374}=0.86 \%$
b. In solution 1, since all the ligand is consumed in the formation of the complex,

$$
\left[\mathrm{CoL}_{3}^{2+}\right]=\frac{2 \times 10^{-5}}{3}=0.667 \times 10^{-5}
$$

Absorptivity of the complex $\mathrm{CoL}_{3}{ }^{2+}$ is
$\epsilon=\frac{0.203}{0.667 \times 10^{-5} \mathrm{molL}^{-1} \times 1.0 \mathrm{~cm}}=3.045 \times 10^{4} \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$

If the concentration of the complex $\mathrm{CoL}_{3}{ }^{2+}$ in solution 2 is C ,

$$
C=\frac{0.68}{3.045 \times 10^{4} \mathrm{~L} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} \times 1.0 \mathrm{~cm}}
$$

$=\quad 2.233 \times 10^{-5} \mathrm{M}$
$\left[\mathrm{Co}^{2+}\right]=\left[\mathrm{Co}^{2+}\right]_{\text {total }}-\left[\mathrm{CoL}_{3}{ }^{2+}\right]$
$=3 \times 10^{-5}-2.233 \times 10^{-5}=0.767 \times 10^{-5}$

Similarly,
$[\mathrm{L}]=[\mathrm{L}]_{\text {total }}-3\left[\mathrm{CoL}_{3}{ }^{2+}\right]$
$=7 \times 10^{-5}-3 \times 2.233 \times 10^{-5}=0.300 \times 10^{-5}$

The complex formation reaction is
$\mathrm{Co}^{2+}+3 \mathrm{~L} \rightleftharpoons\left[\mathrm{CoL}_{3}{ }^{2+}\right]$
The stability constant $K$ is given by

$$
\begin{aligned}
\mathrm{K}= & \frac{\left[\mathrm{CoL}_{3}^{2+}\right]}{\left[\mathrm{Co}^{2+}\right][\mathrm{L}]^{3}} \\
& =1.08 \times 10^{17}
\end{aligned}
$$

12. Reactions in buffer medium

$$
\begin{aligned}
& \mathrm{RNO}_{2}+4 \mathrm{H}^{+}+4 \mathrm{e} \rightarrow \mathrm{RNHOH}+\mathrm{H}_{2} \mathrm{O} \\
& \mathrm{HOAc} \rightleftharpoons \mathrm{H}^{+}+\mathrm{OAc}^{-} \\
& \mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{OAc}^{-}\right]}{[\mathrm{HOAc}]} \\
& \text { i.e } \\
& \mathrm{pK}_{\mathrm{a}}=\mathrm{pH}+\log \frac{[\mathrm{HOAc}]}{\left[\mathrm{OAc}^{-}\right]}
\end{aligned}
$$

$4.76=5.0+\log \frac{[\mathrm{HOAc}]}{\left[\mathrm{OAc}^{-}\right]}$
$\underline{[\mathrm{HOAc}]}=0.5715$
[OAc ${ }^{`}$ ]
$[\mathrm{HOAc}]+\left[\mathrm{OAc}^{-}\right]=0.500$
$\left[\mathrm{OAc}^{-}\right.$] $=0.3182$
[HOAc] $=0.5-0.3182=0.1818$
mmoles of acetate ( $\mathrm{OAc}^{-}$) present initially in 300 mL
$=0.3182 \times 300=95.45$
mmoles of acetic acid (HOAc ) present initially in 300 mL
$=0.1818 \times 300=54.55$
mmoles of $\mathrm{RNO}_{2}$ reduced
$=300 \times 0.0100=3$
From the stoichiometry of the equation, 3 mmoles of $\mathrm{RNO}_{2}$ will consume 12 moles of $\mathrm{H}^{+}$for reduction. The $\mathrm{H}^{+}$is obtained from dissociation of HOAc .

On complete electrolytic reduction of $\mathrm{RNO}_{2}$,
mmoles of $\mathrm{HOAC}=54.55-12.00=42.55$
mmoles of $\mathrm{OAc}^{-}=95.45+12.00=107.45$
$4.76=\mathrm{pH}+\log \frac{42.55}{107.45}$
$\mathrm{pH}=5.16$

## 13. Identification of an inorganic compound

a. The white gelatinous precipitate in group (III) obtained by qualitative analysis of solution $\mathbf{B}$ indicates the presence of $\mathrm{Al}^{3+}$ ions. The white precipitate with $\mathrm{AgNO}_{3}$ indicates the presence of $\mathrm{Cl}^{-}$ions.

From the above data the compound $\mathbf{A}$ must be a dimer of aluminium chloride $\mathrm{Al}_{2} \mathrm{Cl}_{6}$.
b. The reactions are as follows

$$
\begin{aligned}
& \mathrm{Al}_{2} \mathrm{Cl}_{6} \xrightarrow{\mathrm{H}_{2} \mathrm{O}} 2\left[\mathrm{Al} .6 \mathrm{H}_{2} \mathrm{O}\right]^{3+}+6 \mathrm{Cl}^{-} \\
& 6 \mathrm{Cl}^{-}+6 \mathrm{AgNO}_{3} \longrightarrow 6 \mathrm{AgCl}_{(\mathrm{s})}+6 \mathrm{NO}_{3}^{-}
\end{aligned}
$$

$$
\mathrm{AgCl}_{(\mathrm{s})}+\mathrm{NH}_{4} \mathrm{OH}_{(\mathrm{aq})} \longrightarrow \mathrm{Ag}\left(\mathrm{NH}_{3}\right)^{+} \text {or } \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}^{+}+\mathrm{H}_{2} \mathrm{O}+\mathrm{Cl}^{-}
$$

$$
\mathrm{Al}^{3+}+\mathrm{NH}_{4} \mathrm{OH}_{(\mathrm{aq})} \longrightarrow \mathrm{Al}(\mathrm{OH})_{3(\mathrm{~s})}+\mathrm{NH}_{4}^{+}
$$

$$
\mathrm{Al}(\mathrm{OH})_{3(\mathrm{~s})}+\mathrm{NaOH}_{(\mathrm{aq})} \longrightarrow\left[\mathrm{Al}(\mathrm{OH})_{4}\right]^{-}+\mathrm{Na}^{+}
$$

$$
\left[\mathrm{Al}(\mathrm{OH})_{4}\right]^{-}+\mathrm{CO}_{2} \longrightarrow \mathrm{Al}(\mathrm{OH})_{3(\mathrm{~s})}+\mathrm{HCO}_{3}^{-}
$$

$$
\mathrm{Al}_{2} \mathrm{Cl}_{6}+\mathrm{LIH} \longrightarrow\left(\mathrm{AlH}_{3}\right)_{n} \xrightarrow{\text { excessof } \mathrm{LiH}} \mathrm{Li}\left[\mathrm{AlH}_{4}\right]
$$

## 14. Ionic and metallic structures

a. i. The lattice of NaCl consist of interpenetrating fcc lattices of $\mathrm{Na}^{+}$and $\mathrm{Cl}^{-}$
ii. The co-ordination number of sodium is six since, it is surrounded by six nearest chloride ions.
iii. For NaCl , the number of $\mathrm{Na}^{+}$ions is: twelve at the edge centres shared equally by four unit cells thereby effectively contributing $12 \times 1 / 4=$ $3 \mathrm{Na}^{+}$ions per unit cell and one at body center. Thus, a total of $3+1=4$ $\mathrm{Na}^{+}$ions per unit cell.

Number of $\mathrm{Cl}^{-}$ions is: six at the center of the faces shared equally by two unit cells, thereby effectively contributing $6 \times 1 / 2=3 \mathrm{Cl}^{-}$ions per unit cell and eight at the corners of the unit cell shared equally by eight unit cells thereby effectively contributing $8 \times 1 / 8=1 \mathrm{Cl}^{-}$ion per unit cell. Thus, a total of $3+1=4 \mathrm{Cl}^{-}$ions per unit cell.

Hence, the number of formula units of NaCl per unit cell $=4 \mathrm{Na}^{+}+4 \mathrm{Cl}^{-}=$ 4 NaCl .
iv. The face diagonal of the cube is equal to $\sqrt{2}$ times 'a' the lattice constant for NaCl type structure. The anions/anions touch each other along the face diagonal. The anion/cations touch each other along the cell edge.

Thus, $a=2\left(r^{+}+r^{-}\right)$

Face diagonal $\sqrt{2} \mathrm{a}=4 \mathrm{r}^{-}$

Substituting for 'a' from (1) into (2) we get :
$\sqrt{ } 2 \times 2\left(r^{+}+r^{-}\right)=4 r^{-}$from which,
the limiting radius ratio $\mathrm{r}^{+} / \mathrm{r}^{-}=\underline{0.414}$
v. The chloride ion array is expanded to make the octahedral holes large enough to accommodate the sodium ions since, the $\mathrm{r}_{\mathrm{Na}}{ }^{+} / \mathrm{r}_{\mathrm{Cl}}{ }^{-}$ratio of 0.564 is larger than the ideal limiting value of 0.414 for octahedral six coordination number.
vi. As the cation radius is progressively increased, the anions will no longer touch each other and the structure becomes progressively less stable. There is insufficient room for more anions till the cation / anion radius ratio equals 0.732 when, eight anions can just be grouped
around the cation resulting in a cubic eight coordination number as in CsCl .
vii. Generally, the fcc structure with a six coordination number is stable in the cation/anion radius ratio range 0.414 to 0.732 . That is, if $0.414<$ $\mathrm{r}^{+} / \mathrm{r}^{-}<0.732$ then, the resulting ionic structure will generally be NaCl type fcc.
b.
i. Bragg's law states $\lambda=2 \mathrm{~d}_{\mathrm{hkl}} \operatorname{Sin}(\theta)$
$154 \mathrm{pm}=2 \times \mathrm{d}_{200} \operatorname{Sin}\left(15.8^{\circ}\right)$
$\mathrm{d}_{200}=\frac{154 \mathrm{pm}}{2 \times \operatorname{Sin}\left(15.8^{\circ}\right)}=\frac{154 \mathrm{pm}}{2 \times 0.272}=283 \mathrm{pm}$
Thus, the separation between the (200) planes of NaCl is $\underline{283 \mathrm{pm}}$.
ii. Length of the unit cell edge, $a=d_{100}=2 \times d_{200}$
$\mathrm{a}=2 \times 283 \mathrm{pm}=566 \mathrm{pm}$.
iii. Since it is an fcc lattice,
cell edge, $\left.a=2\left(r_{\mathrm{Na}^{+}}+\mathrm{r}_{\mathrm{Cl}}\right)\right)$
radius of sodium ion $\mathrm{r}_{\mathrm{Na}+}=\frac{\mathrm{a}-2}{2} \mathrm{rCl}^{-}=\frac{566-362}{2}=\underline{102 \mathrm{pm}}$
c.
i. The difference in an hcp and a ccp arrangement is as follows:

The two ' A ' layers in a hcp arrangement are oriented in the same direction making the packing of successive layers ABAB.. and the pattern repeats after the second layer whereas, they are oriented in the opposite direction in a ccp arrangement resulting in a ABCABC... packing pattern which repeats after the third layer.

The unit cell in a ccp arrangement is based on a cubic lattice whereas in a hcp arrangement it is based on a hexagonal lattice.
ii. Packing fraction $=\underline{\text { Volume occupied by } 4 \text { atoms }}$ Volume of unit cell

Let 'a' be the length of the unit cell edge
Since it is an fcc lattice, face diagonal $=\sqrt{ } 2 a=4 r$ $\qquad$

Volume of the unit cell = $a^{3}$

Packing fraction $=\frac{4 \times 4 \pi \mathrm{r}^{3}}{3 \times \mathrm{a}^{3}}$.

Substituting for 'a' from (1) into (2), we get
Packing fraction $=\frac{4 \times 4 \times 22 \times(\sqrt{2})^{3} \times \mathrm{r}^{3}}{3 \times 7 \times(4 r)^{3}}=0.74$
Thus, packing fraction in a ccp arrangement $=\underline{0.74}$
iii. The coordination number(12) and the packing fraction (0.74) remain the same in a hcp as in a ccp arrangement.
d.
i. For an fcc structure, face diagonal $=\sqrt{ } 2 \mathrm{a}=4 \mathrm{r}_{\mathrm{Ni}}$
where $\mathrm{a}=$ lattice constant
$\mathrm{r}_{\mathrm{Ni}}=$ radius of the nickel atom
$\mathrm{r}_{\mathrm{Ni}}=\frac{\sqrt{ } 2 \times \mathrm{a}}{4}=\frac{\sqrt{ } 2 \times 352.4 \mathrm{pm}}{4}=\underline{124.6 \mathrm{pm}}$
ii. Volume of unit cell $=a^{3}=(3.524 \AA)^{3}=43.76 \AA^{3}$
iii. Density of Nickel, $\rho_{\mathrm{Ni}}=\frac{\mathrm{Z} \times \mathrm{M} / \mathrm{N}}{\mathrm{V}}$

No. of Ni atoms, $\mathrm{Z}=4$ for an $f c c$ unit cell

Avogadro constant

$$
\begin{aligned}
N=\frac{Z \times M}{\rho_{N i} V} & =\frac{4 \times 58.69 \mathrm{~g} \mathrm{~mol}^{-1}}{8.902 \mathrm{~g} \mathrm{~cm}^{-3} \times 43.76 \times 10^{-24} \mathrm{~cm}^{3}} \\
N & =\underline{6.02 \times 10^{23} \mathrm{~mol}^{-1}}
\end{aligned}
$$

## 15. Compounds of nitrogen

a.
i. $\quad \mathrm{NO}_{2}$ : No. of electrons in the valence shell around nitrogen
$=5+0+2=7$

The lewis structure for $\mathrm{NO}_{2}$ is as shown below.

## :Ö:: N:ö:

According to VSEPR, the molecule ideally should have linear geometry. However, this molecule has one single unpaired electron present on nitrogen. Due to the repulsion between the unpaired electron and the other two bonded pairs of electrons, the observed bond angle is less than $180\left(132^{\circ}\right)$. Thus, the shape of the molecule is angular as shown below.

ii. $\quad \mathrm{NO}_{2}^{+}:$No. of electrons in the valence shell around nitrogen
$=(5+2+2-1)=8$

The Lewis structure is as shown below

$$
: \ddot{\mathrm{O}}: \text { : } \stackrel{+}{\mathrm{t}}:: \ddot{\mathrm{O}}:
$$

Thus, there are no non-bonded electrons present on nitrogen. The two $\sigma$ - bonds will prefer to stay at $180^{\circ}$ to minimize repulsion between bonded electron pairs giving a linear geometry $\left(180^{\circ}\right)$. The $\pi$-bonds do not influence the shape.

$\mathrm{NO}_{2}^{-}$: No. of electron in the valence shell around nitrogen
$=5+2+1=8$

The Lewis structure is as shown below

## : $\mathrm{O}:: \ddot{\mathrm{N}}: \ddot{\mathrm{O}}:$

In case of $\mathrm{NO}_{2}^{-}$, there is a lone pair of electrons present on nitrogen.
Due to strong repulsion between the lone pair of electrons and the bonded pairs of electrons the angle between the two bond pairs shrinks from the ideal $120^{\circ}$ to $115^{\circ}$.
b. In case of trimethylamine, the shape of the molecule is pyramidal with a lone pair present on nitrogen. Due to the lone pair Me-N-Me angle is reduced from $109^{\circ} 4^{\prime}$ to $108^{\circ}$.

However, in case of trisilylamine, d orbital of silicon and p orbital of nitrogen overlaps giving double bond character to the $\mathrm{N}-\mathrm{Si}$ bond. Thus, delocalisation of the lone electron pair of nitrogen takes place and the resultant molecule is planar with $120^{\circ}$ bond angle.

filled p-orbital
c. Both N and B are tricovalent. However, $\mathrm{NF}_{3}$ is pyramidal in shape. In case of $\mathrm{BF}_{3}$, the $\mathrm{B}-\mathrm{F}$ bond gets double bond character due to the overlapping of p orbitals present on boron and fluorine. The observed bond energy is, therefore, much greater in $\mathrm{BF}_{3}$

d.
i. The difference in boiling points of $\mathrm{NF}_{3}$ and $\mathrm{NH}_{3}$ is due to hydrogen bonding which is present in ammonia.

High electronegativity of fluorine decreases the basicity of nitrogen in $\mathrm{NF}_{3}$. Thus, $\mathrm{NF}_{3}$ does not act as a Lewis base.
ii. In $\mathrm{NF}_{3}$, the unshared pair of electrons contributes to a dipole moment in the direction opposite to that of the net dipole moment of the

N-F bonds. See figure (a).

$\mathrm{NF}_{3}$
(a)

(b) In $\mathrm{NH}_{3}$, the net dipole moment of the $\mathrm{N}-\mathrm{H}$ bonds and the dipole moment due to the unshared pair of electrons are in the same direction. See figure (b).
e.

$$
\begin{aligned}
& 2 \mathrm{NaNO}_{3}+8 \mathrm{Na}(\mathrm{Hg})+4 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Na}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}+8 \mathrm{NaOH}+8 \mathrm{Hg} \\
& \mathrm{NH}_{2} \mathrm{OH}+\mathrm{EtNO}_{2}+2 \mathrm{NaOEt} \rightarrow \mathrm{Na}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}+3 \mathrm{EtOH}
\end{aligned}
$$

$\mathrm{Na}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}$ is the salt of $\mathrm{H}_{2} \mathrm{~N}_{2} \mathrm{O}_{2}$ (Hyponitrous acid).

Structure :

or

16. Structure elucidation with stereochemistry
a.

3-oxo-1,3-pentanedioic acid $\alpha$-Hydroxy carboxylic acids undergo similar reaction.
b. Molecular weight of $\mathbf{A}=236$
$20 \mathrm{~mL} 0.05 \mathrm{M} \mathrm{KOH} \equiv 118 \mathrm{mg} \mathbf{A}$
$1000 \mathrm{~mL} 1 \mathrm{M} \mathrm{KOH} \equiv 118 \mathrm{~g} \mathrm{~A}$
$\therefore$ The acid is dibasic
Molecular weight of $\mathbf{A}=236$
$80 \mathrm{mg} \mathrm{Br} \mathrm{r}_{2} \equiv 118 \mathrm{mg} \mathbf{A}$
$160 \mathrm{gm} \mathrm{Br}_{2} \equiv 236 \mathrm{~g} \mathrm{~A}$
A contains one double bond

It has anisole ring in the molecule

It is formed from $\mathrm{HOOC}-\mathrm{CH}_{2}-\mathrm{CO}-\mathrm{CH}_{2}-\mathrm{COOH}$
It has molecular formula $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{O}_{5}$
Due to steric hindrance the attachment of the aliphatic portion on the anisole ring will be para with respect to $-\mathrm{OCH}_{3}$. Hence the structure will be

As $\mathbf{A}$ forms anhydride the two COOH groups should be on the same side of the double bond.
c. Isomers of $\mathbf{A}$

( E ) 3-( 2-methoxyphenyl )-2-pentenedioic acid

( Z ) 3-( 2-methoxyphenyl )-2-pentenedioic acid

( Z ) 3-( 4-methoxyphenyl )-2-pentenedioic acid
d. Two products are possible when compound $\mathbf{A}$ reacts with bromine.

[1]

[2]

Structures 1 and 2 are enantiomers.
e.

f.

B
 Product obtained by reaction with resorcinol

C
g. In the formation of compound $\mathbf{A}$ from anisole, the attack takes place at the $p$ position of the $\mathbf{O C H}_{3}$ group. However, when compound $\mathbf{B}$ is formed from phenol, the attack takes place at the o-position of the $\mathbf{O H}$ group.

Steric hindrance of $\mathbf{O C H}_{3}$ group favours the attack at the para position. Steric hindrance of the $\mathbf{O H}$ group is less. Thus, the attack is possible at the ortho or para positions. However, addition at ortho position is favoured as it leads to cyclization of the intermediate acid to stable $\mathbf{B}$.
h. Phenol has only one $\mathbf{O H}$ group on the phenyl ring whereas resorcinol has two $\mathbf{O H}$ groups on the phenyl ring at the m-positions. Hence, position 4 is considerably more activated (i.e, electron rich) in the case of resorcinol.

Phenol

Resorcinol

Therefore, under identical reaction conditions, the yield of compound $\mathbf{C}$ is much higher than that of $\mathbf{B}$.

## 17. Organic spectroscopy and structure determination

a. The given Molecular formula is $\mathbf{C}_{3} \mathbf{H}_{6} \mathbf{O}$. Therefore, the possible structures are:

I

II

III

VI

The NMR spectrum of compound $\mathbf{A}$ shows a single peak which indicates that all the protons in A are equivalent. This holds true only for structure I. The IUPAC name of this compound is 2-propanone.

The NMR spectrum of compound B shows four sets of peaks, which indicate the presence of four non-equivalent protons. This holds true for structures III and IV. However, for structure IV, no singlet peak (see peak at $\delta=3$ ) will be observed. So, compound B must have structure III. The IUPAC name is 1 methoxyethene.
b.

Three doublets of doublets centred at $6.5 \mathrm{ppm}, 3.9 \mathrm{ppm}, 3.5 \mathrm{ppm}$ are seen in the spectrum. The assignments in the spectrum are

| $\mathrm{H}_{\mathrm{a}}$ | $:$ | 6.5 ppm |
| :--- | :--- | :--- |
| $\mathrm{H}_{\mathrm{b}}$ | $:$ | 3.5 ppm |
| $\mathrm{H}_{\mathrm{c}}$ | $:$ | 3.9 ppm |

Due to the presence of electron donating $\mathbf{O C H}_{3}$, the trans proton $\mathrm{H}_{\mathrm{b}}$ has higher electron density and thus more shielded than $H_{c}$. Thus, $H_{b}$ appears upfield as compared to $H_{c}$. There is also a singlet line at $\delta=3$. This corresponds to the $\mathbf{H}$ in $\mathbf{O C H}_{3}$.
c. Coupling constants

| $H_{a}$ | $:$ | $12,16 \mathrm{~Hz}$ | $J\left(H_{a}, H_{b}\right)=12 \mathrm{~Hz}$ |
| :--- | :--- | :--- | :--- |
|  |  | $J\left(H_{a}, H_{c}\right)=16 \mathrm{~Hz}$ |  |
| $H_{b}$ | $:$ | $8,12 \mathrm{~Hz}$ | $J\left(H_{a}, H_{b}\right)=12 \mathrm{~Hz}$ |
|  |  | $J\left(H_{b}, H_{c}\right)=8 \mathrm{~Hz}$ |  |
| $H_{c}$ | $:$ | $8,16 \mathrm{~Hz}$ | $J\left(H_{b}, H_{c}\right)=8 \mathrm{~Hz}$ |
|  |  | $J\left(H_{c}, H_{a}\right)=16 \mathrm{~Hz}$ |  |

Note: $J=$ (difference in two lines in ppm) x (Instrument frequency)
Geminal coupling < cis-vicinal coupling < trans-vicinal coupling
d.

| Peak positions in Hz <br> (for $\mathbf{4 0 0} \mathbf{~ M H z}$ instrument) | Peak positions in Hz <br> (for $\mathbf{6 0 0} \mathbf{~ M H z}$ instrument) |
| :---: | :---: |
| 2614 | 3921 |
| 2602 | 3903 |
| 2598 | 3897 |
| 2586 | 3879 |

e. Compound $\mathbf{A}$ will react with malonic acid in the following manner

The structure of Meldrum's acid is consistent with the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and IR data. The peak in the IR spectrum at $1700-1800 \mathrm{~cm}^{-1}$ is because of the $\mathrm{C}=\mathrm{O}$ stretching. The presence of peaks only between $0-7 \delta$ in the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum indicates that the compound doesn't have any acidic group like COOH or OH.

If compound B reacts, the only possibility is that it will add across the double bond giving a product with molecular formula equal to $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}$. This molecular formula does not match with the one stated in the problem.

f. The increased acidity is due to active $-\mathrm{CH}_{2}$ group of Meldrum's acid flanked by two - CO groups. The carbanion formed at $-\mathrm{CH}_{2}$ will be stabilised by these -CO groups, which are coplanar.

Meldrum's acid ( $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{4}$ )
g. The condensation product of Meldrum's acid with an aromatic aldehyde has the structure

18. Polymer synthesis
a. $\quad \mathrm{H}_{2} \mathrm{C}=\mathrm{CH}_{2}+1 / 2 \mathrm{O}_{2} \xrightarrow[250^{\circ} \mathrm{C}]{\mathrm{Ag} \mathrm{cat}}$

P

b.

C.

p-xylene

dimethyl benzene-1,4-bis(acetate)
d. Three signals (three singlets for $-\mathrm{CH}_{3},-\mathrm{CH}_{2}$ and aromatic protons)
e. Structure of polymer

f.

g. With Glycerol (being a triol), cross-links between the polymer chains involving the secondary hydroxyl group will form a three-dimensional network polymer.

Glycerol

The polymer is unsuitable for drawing fibers because of its Cross-linked, resin-like property.

## 19. Organic synthesis involving regioselection

a. The product obtained in the presence of catalyst $\mathrm{HSbF}_{6}$ is $m$-bromophenol.

From the mass spectra given in the problem, direct bromination of phenol gives $\mathrm{o} / \mathrm{p}$-bromo derivatives as OH group present in phenol is o/p-directing.
b.

Compound B may undergo nucleophilic reaction at the carbon bearing bromine. Compound $\mathbf{C}$ contains a carbanion and hence functions as a nucleophile and will attack an electrophile. Thus, reactivity of $\mathbf{B}$ is reversed on its conversion to $\mathbf{C}$ (umpolung).
c.

Cyclohexanone

C
D
Tramadol
d.

Tramadol has two asymmetric carbon atoms. It has two pairs of enantiomers .

## 20. Carbon acids

a. The molecular formula of the keto ester is $\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{O}_{3}$. Since X and Y are keto esters, they must have the following units-

This accounts for $\mathrm{C}_{4} \mathrm{O}_{3}$. The remaining part comprises of $\mathrm{CH}_{8}$. Thus, only two types of ester groups are possible, methyl or ethyl.

For a methyl ester: $\mathbf{C H}_{3}$ will be a part of the ester moiety. This leaves $\mathrm{CH}_{5}$ to be attached.

For an ethyl ester: $\mathbf{C H}_{2} \mathbf{C H}_{3}$ will be a part of the ester group. Therefore $\mathrm{H}_{3}$ unit needs to be accounted for.

Therefore, possible structures of the keto esters are:

Structure I

Structure II

## Structure III

b. Reaction sequence for keto esters
*

Structure I

Keto acid ( $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{O}_{3}$ )

*

( $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}$ )

- Structure I gives a keto acid with molecular formula $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{O}_{3}$ which matches with the formula of the keto acid obtained from $\mathbf{Y}$.
$\therefore$ Structure I is $\mathbf{Y}$.
- Structure II gives a neutral compound with molecular formula $\mathbf{C}_{11} \mathbf{H}_{14} \mathbf{O}$ that matches with the molecular formula of the neutral acid stated for $\mathbf{X}$.
$\therefore$ Structure II is X .
- Structure III gives a keto acid with molecular formula $\mathbf{C}_{11} \mathbf{H}_{12} \mathbf{O}_{3}$ that also does not match with any given molecular formula.

Hence the two keto esters are :

Compound $\mathbf{Y}$
(Structure I)
$\alpha$-keto ester

Compound $\mathbf{X}$
(Structure II)
$\beta$-keto ester
c. The $\beta$-keto ester gives on hydrolysis a $\beta$-keto acid. This acid readily undergoes decarboxylation involving a 6-membered transition state, giving a neutral product ( Ketone ).

d. i. When 1 equivalent of LDA is used compound $\mathbf{X}$ produces a carbanion (monoanion) as shown below.

ii. Use of 2 equivalents of LDA leads to the formation of a dianion.

## 21. Amino acids and enzymes

a. The protonated amino group has an electron withdrawing effect. This enhances the release of proton from the neighboring -COOH , by stabilizing the conjugate base $-\mathrm{COO}^{-}$. This effect is greater when the $-\mathrm{COO}^{-}$is physically closer to $-\mathrm{NH}_{3}{ }^{+}$. As $-\mathrm{NH}_{3}{ }^{+}$group is present on the $\alpha$-carbon, the effect is greater on $\alpha-\mathrm{COOH}$ than on the $\gamma-\mathrm{COOH}$. So the pKa value of $\alpha-$ COOH is lower than that of $\gamma-\mathrm{COOH}$.
b. The ratio of ionized to unionized $\gamma-\mathrm{COOH}$ group is obtained by using Henderson-Hasselbalch equation,
$\mathrm{pH}=\mathrm{pK}_{\mathrm{a}}+\log \frac{\left[\mathrm{COO}^{-}\right]}{[\mathrm{COOH}]}$

The $\mathrm{pH}=6.3$ and pKa of $\gamma-\mathrm{COOH}$ group is 4.3. Substituting these values in the above equation we get,

$$
\begin{aligned}
& 6.3=4.3+\log \frac{\left[\mathrm{COO}^{-}\right]}{[\mathrm{COOH}]} \\
& \therefore[\mathrm{COOH}]=\frac{100}{101}=0.99 \% \text { at } \mathrm{pH} 6.3
\end{aligned}
$$

c. Glutamic acid has two pKa values lower than 7.0 and one pKa value higher than 7.0. Thus, the isoelectric point (pl) for glutamic acid will lie between the two acidic pKa values.
$\mathrm{pl}=(2.2+4.3) / 2=3.25$
At $\mathrm{pH}=3.25$, net charge on glutamic acid will be zero since this pH coincides with pl of glutamic acid. Hence, glutamic acid will be stationary at pH 3.25 .
d. In the hydrolysis of the glycosidic bond, the glycosidic bridge oxygen goes with $\mathrm{C}_{4}$ of the sugar $\mathbf{B}$. On cleavage, ${ }^{18} \mathrm{O}$ from water will be found on $\mathrm{C}_{1}$ of sugar $\mathbf{A}$.

NOTE: The reaction proceeds with a carbonium ion stabilized on the $\mathrm{C}_{1}$ of sugar A
e. Most glycosidases contain two carboxylates at the active site that are catalytically important. Lysozyme is active only when one carboxylate is protonated and the other is deprotonated. A descending limb on the alkaline side of the pH profile is due to ionization of -COOH . An ascending limb on the acidic side is due to protonation of $-\mathrm{COO}^{-}$. Thus the enzyme activity drops sharply on either side of the optimum pH . The ideal state of ionization at $\mathrm{pH}=$ 5 will be,

NOTE: It is desirable to study the amino acid side chains (R-groups) and their ionization properties. The pKa values of these groups significantly determine the pH dependence of enzyme activity.
f. Answers 2 and 4 are correct. Ionization of -COOH leads to generation of a negatively charged species, $-\mathrm{COO}^{-}$. This charged species is poorly stabilized by diminished polarity and enhanced negative charge. Hence ionization of -COOH group is suppressed and the pKa is elevated.
g. The ratios of pseudo-first order rate constant (at $1 \mathrm{M} \mathrm{CH}_{3} \mathrm{COO}^{-}$) in (a) to the first order rate constants in (b) and (c) provide the effective local concentrations.
For example,
(2) $\quad(0.4) /(0.002)=200$
i.e the effective concentration $=200 \mathrm{M}$
(3) $\quad(20) /(0.002)=10,000$
i.e the effective concentration $=10,000 \mathrm{M}$
h. In addition to the enhanced local concentration effect, the $\mathrm{COO}^{-}$group in (3) is better oriented to act in catalysis. The double bond restricts the motion of $\mathrm{COO}^{-}$and thus reduces the number of unsuitable orientation of $-\mathrm{COO}^{-}$, thereby enhancing the reaction rate.

## 22. Coenzyme chemistry

a. Step 1: Schiff base formation

Step 2: Proton abstraction

Step 3: Reprotonation

Step 4: Hydrolysis

b. From the information stated in the problem, the following conclusions can be drawn:

Structure 2: Removal of the phosphate group does not hamper the activity. This indicates that the phosphate is not critical for the activity of PLP.

Similarly,
Structure 3: $\mathrm{CH}_{2}-\mathrm{OH}$ is not critical.
Structure 4: Phenolic OH is needed in the free form.
Structure 5: $\mathrm{NO}_{2}$, a well-known electron withdrawing group, causes benzaldehyde to become activated. Hence positively charged nitrogen in structure 3 must be also important for its electron withdrawing effect.

Structure 6: Electron withdrawing effect of $\mathrm{NO}_{2}$ is only effective from the para position. Introduction of this group at meta position leads to an inactive analog.
c. Role of metal ion: The metal ion is involved in a chelation, as shown below, and provides an explanation for the critical role of the phenolic OH . The planar structure formed due to chelation assists in the electron flow.

d. Step 1: Schiff base formation and decarboxlyation

$+\quad \mathrm{CO}_{2}$

Step 2: Tautomerization

Step 3: Hydrolysis

e. Step 1: Schiff base formation followed by carbon- carbon bond scission.

Step 2: Tautomerization followed by hydrolysis

## 23. Protein folding

a. The planar amide group, that is, $\mathrm{C}_{\alpha}, \mathrm{O}, \mathrm{H}$ and the next $\mathrm{C}_{\alpha}$ are in a single plane - is stabilized by resonance. The C-N bond of the amide assumes partial double bond character and the overlap between p orbitals of $\mathrm{O}, \mathrm{C}$ and N is maximized. The $\mathrm{C}_{\alpha}$ 's across this partial double bond can assume cis or trans arrangement.

b. With nineteen of the amino acids, the trans arrangement is sterically favoured (i. e. it is comparatively less crowded). In the case of proline, cis and trans arrangements are almost equally crowded.

c. Note about Ramchandran diagram: In a polypeptide, the amide units are planar (partial double bond character across the N-C bond) but the bonds connecting N and $\mathrm{C}_{\alpha}$, and the carbonyl carbon and $\mathrm{C}_{\alpha}$ are free to rotate. These rotational angles are defined as $\phi$ and $\psi$, respectively. The conformation of the main chain is completely defined by these angles. Only some combinations of these angles are allowed while others are disallowed due to steric hindrance. The allowed ranges of $\phi$ and $\psi$ angles are visualised as a steric contour diagram, shown below, known as the Ramachandran diagram.

For nineteen amino acids, the conformational choice is largely restricted to the so-called $\alpha$ and $\beta$ regions on left half of the Ramachandran diagram (Panel A). This is due to the $L$ - chiral nature of amino acids and the steric effects of their R groups. Glycine is an achiral residue with H as the R group. Therefore, much larger conformational regions on both left and right halves of Ramachandran diagram are accessible to this residue (Panel B).

Panel A

Panel B
d. Consecutive residues in $\alpha$ conformation form the $\alpha$-helix. Similarly, consecutive residues in $\beta$ conformation form the $\beta$-sheet. Both $\alpha$-helix and $\beta$ sheet structures feature extensive networks of hydrogen bonds which stabilise them. Thus random combinations of $\alpha$ and $\beta$ conformations are rarely found.

e. For a polypeptide to fold in an aqueous environment, nearly half the R groups should be nonpolar (water hating) and the other half polar (water loving). Upon folding to form a globular protein, the nonpolar R groups are packed inside (away from water) while the polar groups are positioned on the surface (in contact with water). The phenomenon is similar to the hydrophobic aggregation of a micellar structure in water. If all the $R$ groups are either polar or non-polar, no hydrophobic segregation is possible, and no folding will occur.

f. Alternating polar/nonpolar periodicity of R groups favors $\beta$-sheets. All the nonpolar groups will face the apolar surface while the polar groups will be exposed to water. So the net folding will be like a $\beta$-sheet. On the other hand, a complex periodic pattern of $R$ group polarities is needed in forming the $\alpha$ helix.

Periodicity ~ 2.0

Periodicity ~ 3.5

$\left.\begin{array}{|llll|}\hline \begin{array}{l}\text { Hydrophobic } \\ \text { periodicity } \\ \text { (primary } \\ \text { sequence) }\end{array} & +\quad \begin{array}{l}\text { Apolar } \\ \text { surface } \\ \text { (interface) }\end{array}\end{array} \Rightarrow \quad \begin{array}{l}\text { Induced } \\ \text { (secondary } \\ \text { structure) }\end{array}\right]$

## 24. Protein sequencing

The sequence of amino acids in a protein or polypeptide is expressed starting from the N -terminal amino acid. From Edman degradation method the N -terminal amino acid is Asp. In the N -terminal fragment generated by trypsin or CNBr this amino acid should, therefore, be in position1. All other peptides generated by CNBr cleavage will be preceded by Met on their N -terminal side. Likewise, all peptides generated by trypsin should be preceded by Arg or Lys. As we proceed from N -terminal amino acid to C-terminal amino acid, we carefully examine the different amino acids in each position shown in Table1 (a) and 1 (b)

For the first fragment starting from N-terminal Asp in position 1, we look for residues common in each position to CNBr and trypsin cleaved peptides. This gives

| Position | 1 | 2 | 3 | 4 | 5 | 6 |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Residue |  | Asp | -Pro/Tyr | - Tyr | -Val | -lle/Leu | -Arg |

At position 6 Arg will render the polypeptide susceptible to trypsin. Therefore, $7^{\text {th }}$ residue of this CNBr fragment (Table1a) should be same as residue1 in another peptide generated by trypsin and $8^{\text {th }}$ residue of this CNBr fragment will be same as residue 2 in Table 1(b). Therefore we get

## $7 \quad 8$

Gly/Phe - Tyr
Since 8 will be Tyr, Pro will be assigned to position 2 of the polypeptide

Residue 9 in the polypeptide should be at position 3 in the Table1(b) and residues $10,11,12,13$ and 14 should be at positions $4,5,6,7$ and 8 respectively in Table1(b). The same residues should be in positions 1 onwards in Table1(a).

None of the residues in position 3 (Table1b) is same as in position 1 in Table 1(a). However, positions 4 to 8 in Table 1(b) have residues common with positions 1 to 5 in Table 1(a). Further Glu in position 1 (Table 1a) will be preceded by Met (since it is a part of CNBr cleaved peptide). And position 3 in Table 1(b) has Met. Therefore, we get

| 9 | 10 | 11 | 12 | 13 | 14 |
| :--- | :--- | :--- | :--- | :--- | :--- |

Met- Glu - Thr - Ser - Ilu - Leu

Position 5 in the polypeptide can now be firmly assigned to llu

Positions 15 and 16 in the polypeptide will be beyond residue 8 in the trypsin cleaved peptide (not shown here). We now attempt to construct the remaining trypsin or CNBr fragments.

Table 1 (a) shows Arg in position 1. This will be preceded by a Met. Matching of the unassigned residues in position 2 in Table 1(a) with those in position 1 in Table 1(b) and for subsequent positions by the procedure demonstrated earlier that will give.

Met - Arg - Tyr - Pro - His - Asn - Trp - Phe - Lys - Gly - Cys
(The last two residues are the unassigned residues in position 1 and 2 in Table 1b) Considering (2), (5) and (6) together it is now possible to firmly assign position 7 on the polypeptide to Gly
a. The amino acid sequence common to the first fragments (N-terminal) obtained by CNBr and trypsin treatments is

| 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: |
| Asp | Pro | -Tyr | -Val | -Ile |

b. The sequence of the first fragment generated by CNBr treatment is

| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Asp- | Pro | - Tyr- | Val- | Ile | -Arg | -Gly | -Tyr |

To complete the sequence of the polypeptide we need to construct the sequence of another trypsin fragment. Starting from position 4 -(Arg) in Table 1(a) we get the sequence,

Arg-Phe-His-Thr-Ala
At this stage, we again examine the unassigned residues. The Arg in (8) will have to be serially preceded by Asn, Gln, Gly and Met (these are the unassigned residues in respective positions in Table 1(a). We then get the sequence,

Met-Gly-Gln-Asn-Arg-Phe-His-Thr-Ala

And following the Ala in (9)

Leu-Ser-Cys-Glu

From (9) and (10), we get the sequence

Met-Gly-Gln-Asn-Arg-Phe-His-Thr-Ala-Leu-Ser-Cys-Glu

Since the smallest fragment is a dipeptide (Table 1b) and (6) shows that it follows Lys, it follows that this will be at the C-terminal end. Therefore, the partial sequence shown in (6) will follow the partial sequence shown in (11).Thus, we get

Met-Gly-Gln-Asn-Arg-Phe-His-Thr-Ala-Leu-Ser-Cys-Glu-Met-Arg-Tyr-Pro-His-Asn-Trp-Phe-Lys-Gly-Cys

There is already a Met in position 9 of the polypeptide. The next Met can only come earliest at position 17 since CNBr fragment have at least 8 amino acids. Therefore, the starting residues of (12) can be assigned position 17.

This leaves positions 15 and 16 which will be filled by the unassigned residues Val and Ala in the CNBr fragment at positions 6 and 7 (Table 1a).
c. The final sequence, therefore, will be

CNBr Trypsin

| 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | $\downarrow$ | 31 | $\downarrow$ | 32 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |$\quad 33$

| 34 | 35 | 36 | 37 | $\left.\begin{array}{rl}\text { Trypsin } \\ \\ \downarrow\end{array}\right] 39$ | 40 |
| :--- | :--- | :--- | :--- | :--- | :--- |

His - Asn - Trp - Phe - Lys - Gly - Cys

Arrows $(\downarrow)$ indicate the CNBr and trypsin-labile sites.
d. There are 6 basic amino acid residues in the polypeptide. $6 / 40=15 \%$
e. An $\alpha$ helix has 3.6 amino acid residues per turn of $5.4 \AA$.

Thus, the length of the polypeptide in $\alpha$ helical conformation will be :
$40 / 3.6 \times 5.4=59.4 \AA$.
f. The polypeptide has 40 amino acids. Since each amino acid is coded for by a triplet of nucleotides, the total number of nucleotide pairs in the double stranded DNA of the exon will be
$40 \times 3=120$ base pairs.

The molecular weight of the DNA making the exon
$=330 \times 2 \times 120$
$=79200 \mathrm{D}$
g. If the exon contains 120 base pairs and $A$ and $C$ are in equal numbers, there will be 60 A-T pairs and 60 G-C pairs. Each A-T pair is held by two H-bonds and each G-C pair is held by three H-bonds. Hence the total number of Hbonds holding this double helix is :
$(60 \times 2)+(60 \times 3)=300$
